# What is UniversalAutomation.org?

# WHY

## Universal Automation?

### INNOVATION BARRIER

My digitization strategy is stalled because of the high cost to get data from my existing controllers

### SOFTWARE RE-USE

I'm obliged to rewrite my SW application when my HW reaches end-of-life

### MANAGING MULTIPLE SUPPLIERS

My maintenance teams have to learn multiple SW tools resulting in higher MTTR

Each new system is just “new legacy” 15 years later!

### ATTRACTING TALENT

It is difficult to attract talented young software engineers!

## WHY

### Universal Automation?

## SUMMARY

 **Vendor lock** increases my costs  
& reduces my ability to innovate!

# Automation Systems must become more Universal

Control **application software** must be **vendor-independent**

Shared technology to make **portability** a reality

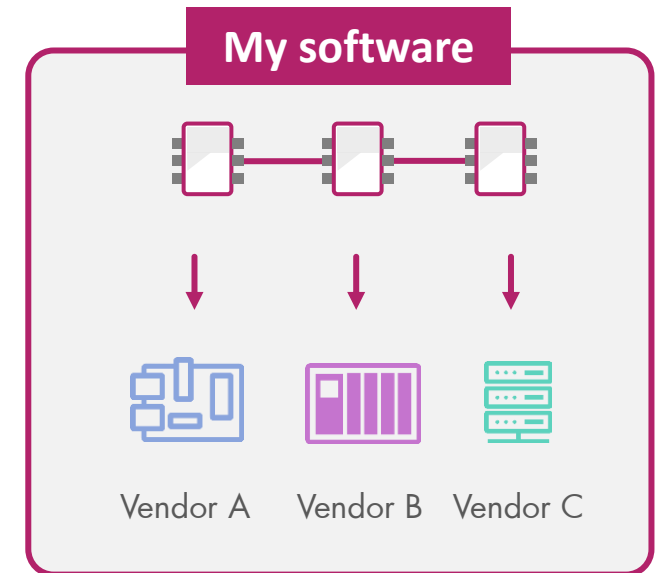

Facilitate re-use of software – **Plug & Produce**

Emergence of **edge compute/edge control architectures**

Appeal to **young software engineers** – Modern Tech

UniversalAutomation.org

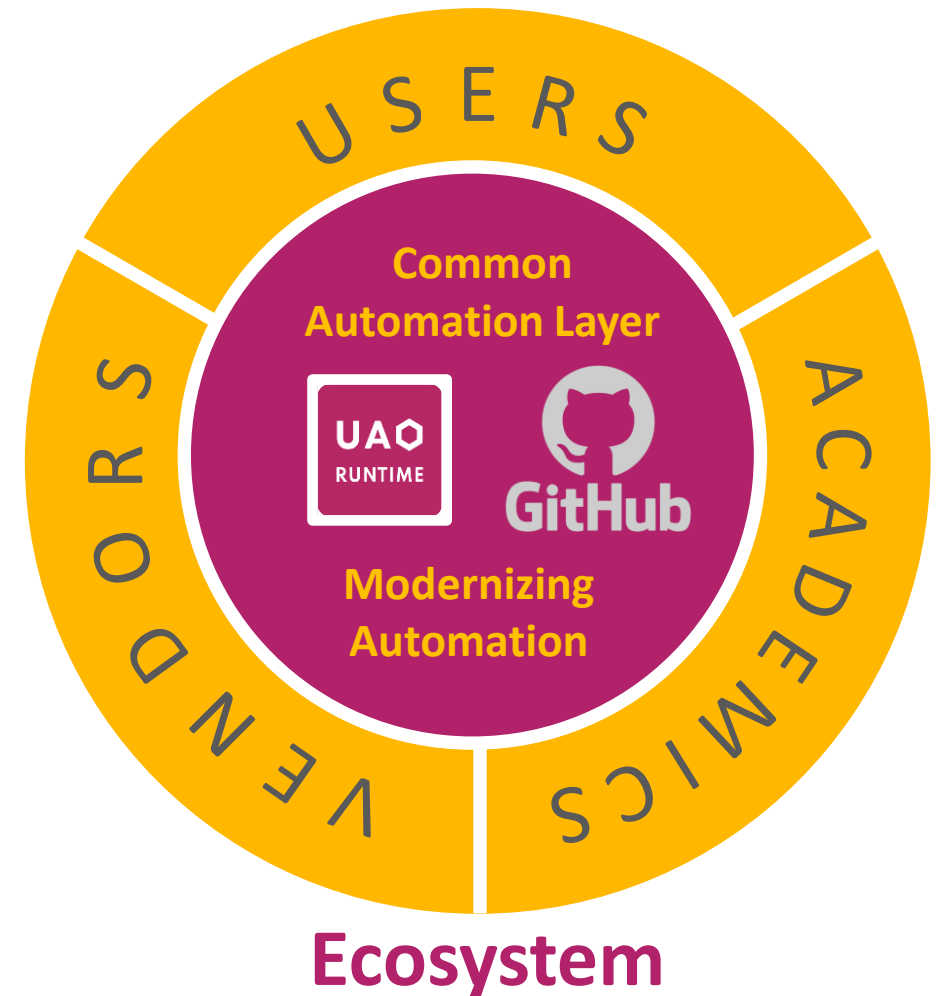

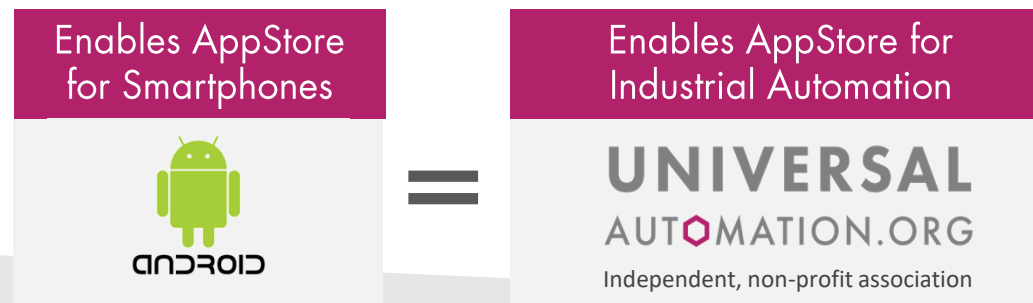

## The Missing Link for Industry 4.0

1. A **common automation layer** based on IEC 61499

managed by

2. An **Ecosystem** of Users, Vendors & Academics

## A Community – Not a Standardization Body !

**WE  
are**

A community of users, vendors and academics organized around an independent non-profit association

**WE  
use**

Universal automation platforms that use a **shared-source IEC 61499 runtime execution engine**

**WE  
promote**

**Portability/Reusability** of vendor-independent automation application software

### Benefits

- ✓ Maximize application portability across vendor platforms
- ✓ Remove issues linked to « interpretation » of written standard
- ✓ Release universal automation offers in months rather than years

# Getting Started with UniversalAutomation.org

Start benefiting from the technology right away

# Transform your Legacy Systems with IEC 61499

## Modernize Without Disruption: Unlock the Power of IEC 61499

Transform your existing systems without interrupting ongoing operations. By leveraging IEC 61499, you can modernize your automation infrastructure while maintaining business continuity.

### Key Benefits:

- **Non-Disruptive Modernization**

Upgrade legacy systems incrementally, ensuring continuous operation throughout the transition.

- **Enhanced Efficiency and Decision-Making**

Enable real-time data exchange between Operational Technology (OT) and Information Technology (IT) layers, improving responsiveness and insight-driven decisions.

- **Seamless System Integration**

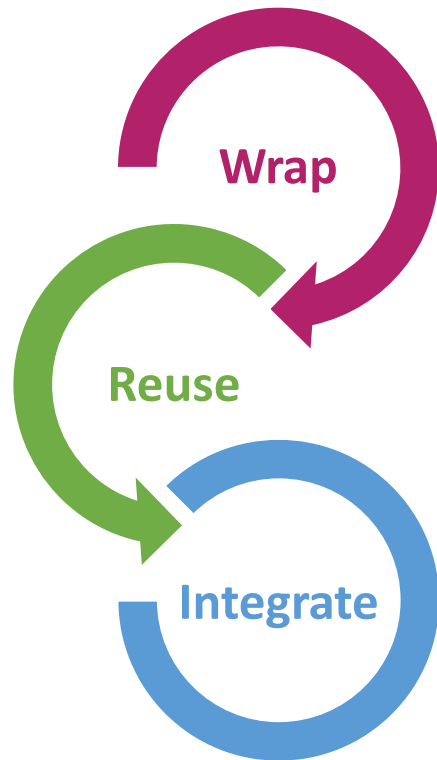

IEC 61499 facilitates smooth communication and coordination across diverse system components, regardless of vendor or platform.

## Integrate and Expand your Current Systems

- **Wrapping** legacy systems within a new interface that complies with the IEC 61499 standard allows these systems to continue operating while benefiting from advanced features.
- **Reusability** is achieved by encapsulating functionalities into Function Blocks, which can be adapted and reused, reducing development time and costs
- **Integrating** legacy systems into IEC 61499 system creates a cohesive, distributed control system and enables interoperability, data exchange, and coordinated control between new and old systems provided by the **IEC 61499 based Plant orchestration layer**.

# Integrate and Expand your Current Systems

## How it works:

- A wrapper function block is created in IEC 61499.
- This wrapper acts as a proxy or interface to the legacy system.
- Communication is typically handled via standard protocols (e.g., OPC UA, Modbus, MQTT).
- The legacy system continues to operate as-is but can now interact with modern components.

## Benefits:

- Preserves investment in legacy systems, no need to rewrite legacy code.
- Enables integration with modern, distributed systems.
- Improves flexibility and scalability
- Legacy systems can be monitored and managed using modern tools.
- Enables gradual migration to modern architectures

# Installed Base Strategy

**Principle 1:** wrap & reuse existing legacy systems

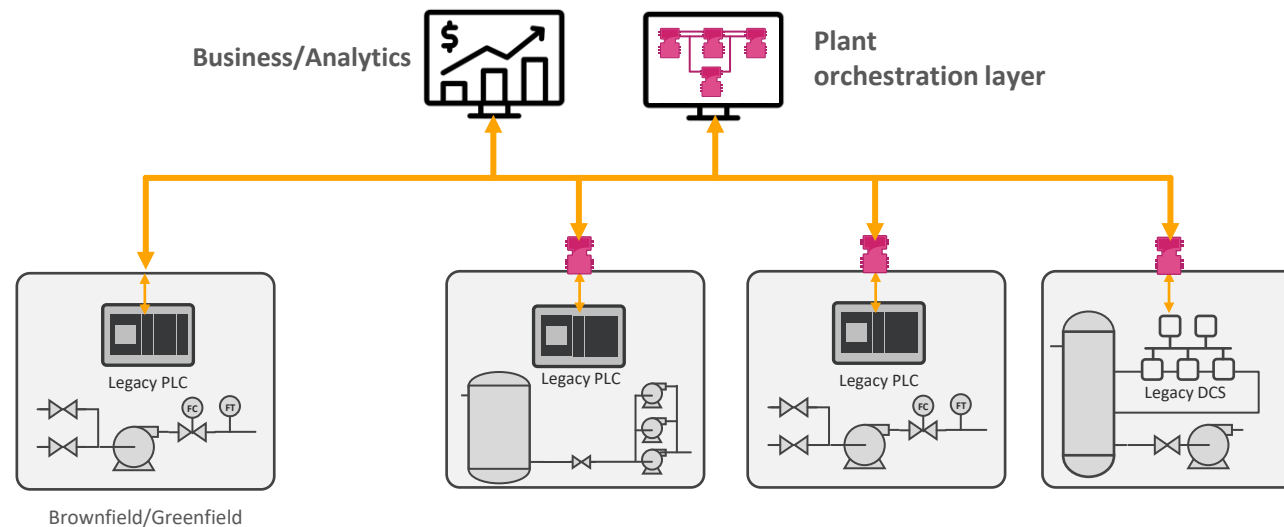

Build library of universal automation software components to interface legacy systems to site/enterprise-level orchestration

**Principle 2:** for new automation systems, stop installing “new legacy”

Universal Automation: multi-vendor, portable software components, flexible architectures

**Principle 3:** upgrade systems to universal automation as they become obsolete

If possible, replace CPU's while conserving IO and field cabling

# IEC 61499 as the Foundation for Orchestration

Implementing **IEC 61499 as the Plant Orchestration Layer** allows for distributed, event-driven control without disrupting existing production. Each machine or process retains its autonomy while participating in a coordinated, modular system - ensuring seamless integration, scalability, and optimal performance.

## Key Benefits:

- **Simplified Integration**

Seamlessly connects equipment from multiple vendors, reducing engineering complexity and integration time.

- **Increased Flexibility**

Enables process line evolution and reconfiguration without requiring direct support from each individual vendor.

- **Improved Coordination and Performance**

Enhances synchronization across machines, leading to more efficient operations and measurable performance gains.

## Begin with a Non-Critical System

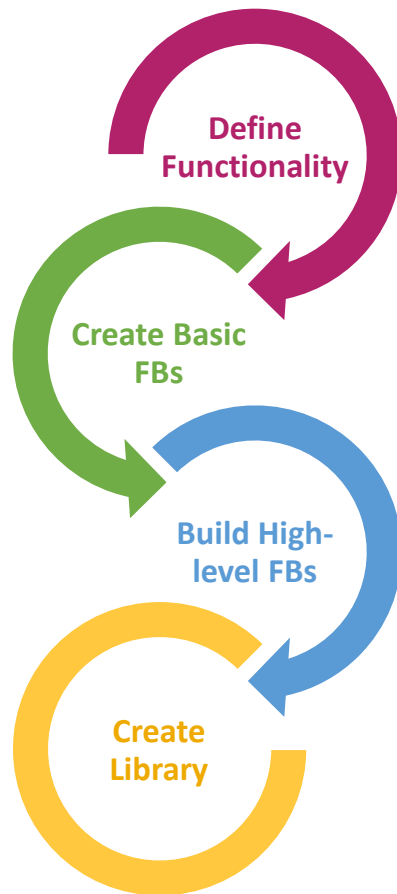

- To ease the adoption of IEC 61499, it is recommended to start by applying the technology to a non-critical system. This approach allows teams to explore and understand the framework without impacting essential operations.

Select a system such as:

- Temperature monitoring
  - Humidity tracking
  - Air quality sensing
  - HVAC (Heating, Ventilation, Air Conditioning)
  - Compressed Air Monitoring (if not directly tied to production tools)
  - Water Supply for Sanitation
- These systems are ideal for experimentation because they:
    - **Operate independently** of core production processes
    - Allow **safe testing of event-driven function blocks**
    - Provide a practical introduction to **distributed control architectures**

By starting with a low-risk application, teams can **build confidence and expertise in IEC 61499** before scaling to more critical systems.

# Begin with a Non-Critical System

## Define the Functional Description

Begin by decomposing the system into logical components based on its functionality and physical layout. This modular approach ensures clarity, scalability, and ease of maintenance.

## Create Basic Function Blocks (FBs)

Develop individual Function Blocks for each fundamental physical or logical element of the system. These FBs encapsulate specific behaviors or control logic, making them reusable and testable units.

## Build High-Level Function Blocks

Combine the basic FBs into more complex, high-level FBs that represent integrated subsystems or major functional units. This hierarchical structure supports abstraction and simplifies system integration.

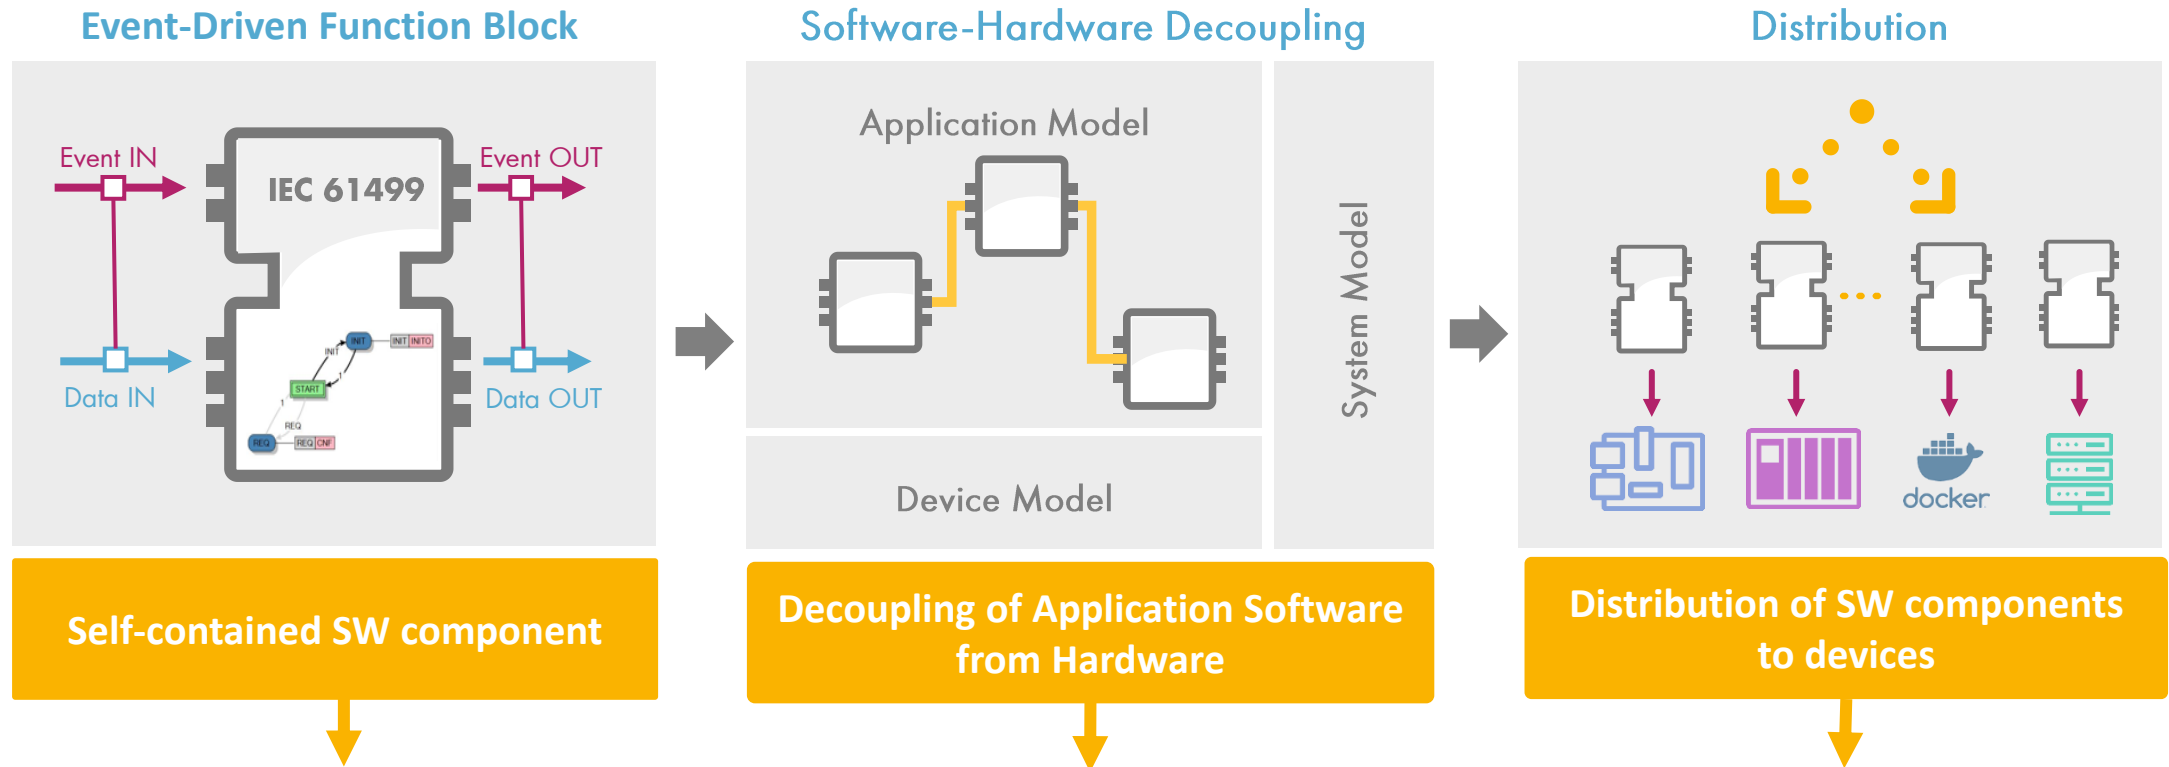

## Develop a Reusable FB Library

Organize all FBs into a structured library of reusable components. This library can be leveraged to efficiently program and integrate similar systems within the IEC 61499 environment, promoting consistency and reducing development time.

# Deeper into UniversalAutomation.org

# IEC 61499

## The Technology Enabler of UAO

“Plug & Produce programming using hardware-independent, proven-in-use libraries of software components”

## A Community – Not a Standardization Body !

**WE  
are**

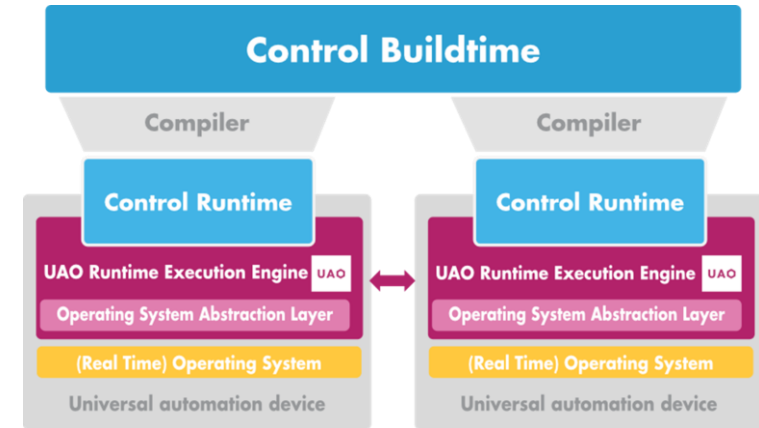

A community of users, vendors and academics organized around an independent non-profit association

**WE  
use**

Universal automation platforms that use a shared-source IEC 61499 runtime execution engine

**WE  
promote**

Portability/Reusability of vendor-independent automation application software

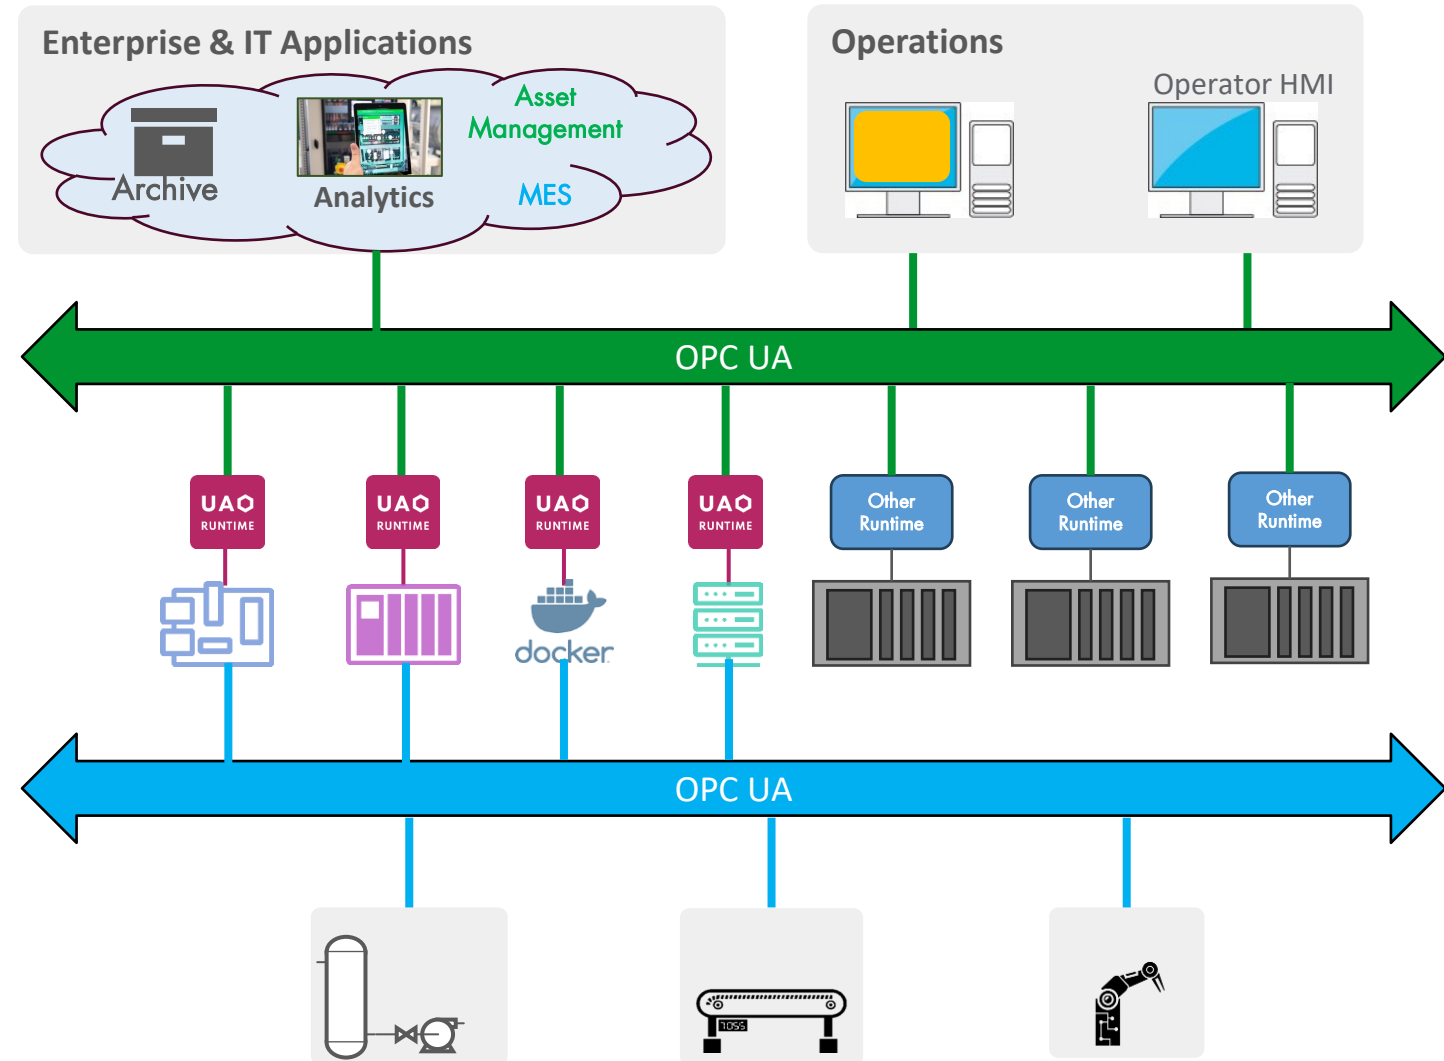

### Benefits

- ✓ Maximize application portability across vendor platforms
- ✓ Remove issues linked to « interpretation » of written standard
- ✓ Release universal automation offers in months rather than years

# UniversalAutomation.org Runtime & OPC UA

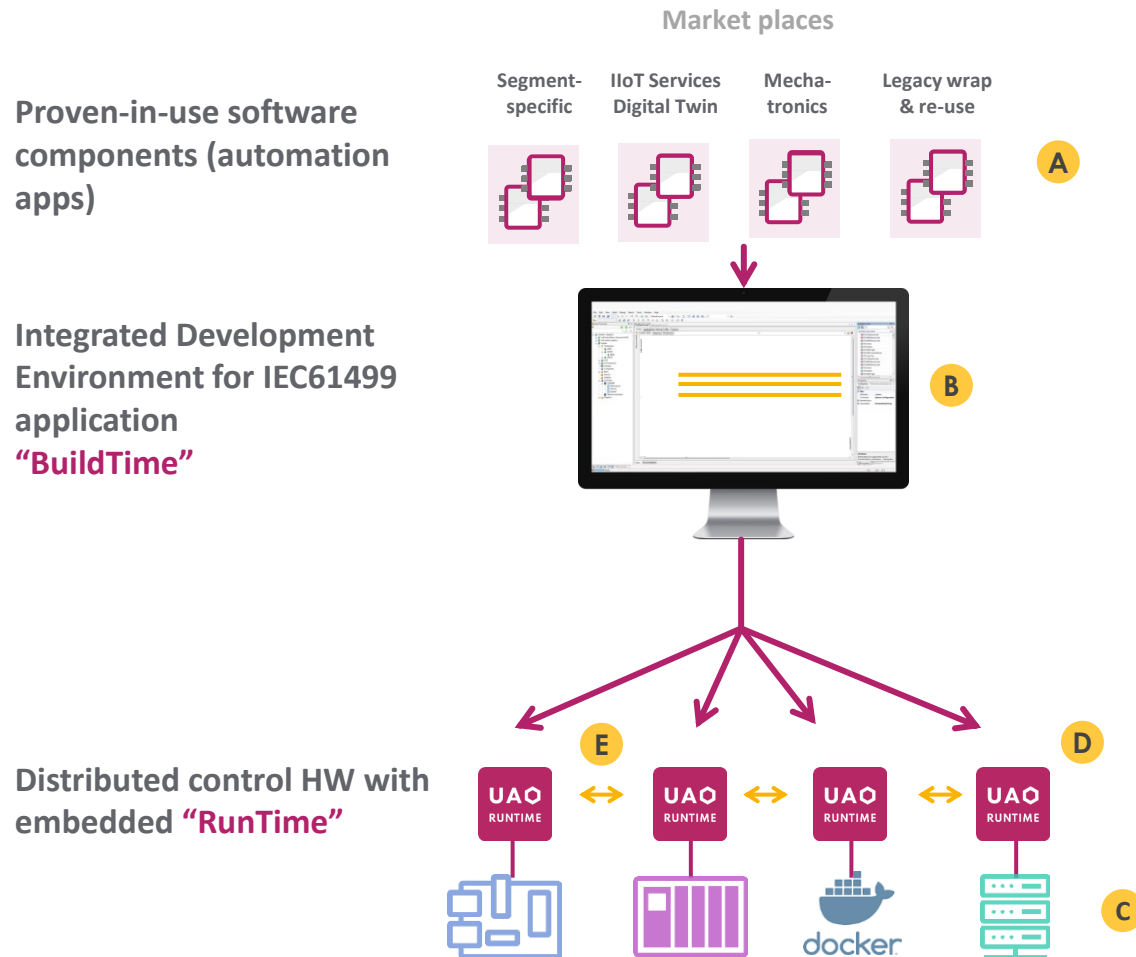

- Unified Automation High Performance Stack
- Both OPC UA Server and Client available
- Server Namespace – Modeled, Prepared and compiled in buildtime & deployed to runtime.
- OPC UA Client modeled as a set of Service Interface Function Blocks for use in application.

## Plug & Produce SW Components:

# The Missing Link for Industry 4.0

- A Instantiate from library
- B Program whole application
- C Select hardware topology
- D Deploy application to controllers
- E Inter controller communications generated automatically

# Plug & Produce SW components

Proven-in-use software components (automation apps)

Integrated Development Environment for IEC61499 application  
"BuildTime"

Distributed control HW with embedded "RunTime"

"Plug & Produce"

"Write once, distribute across universal automation devices"

## Today

# End Users are Using the Technology

- Using UAO runtime execution engine in OPAF test bed since 2018
- Real-life field trial ongoing
  - Replace existing DCS/PLC's
  - 2000 IO points, 90+ loops
  - UAO runtime + OPC UA

KONGSBERG

- Orchestration layer above existing legacy controllers
- Additional IT/OT applications

- Built “Reference IEC 61499 application”
- Multi-vendor system commissioned:  
R. Stahl, Schneider Electric, ESA

- Objective – decouple application library from vendor platforms
- Ongoing food oil unloading application with EcoStruxure Automation Expert

- Real-time process control
- Predictive maintenance
- Improved automation scalability
- Reduced machine stoppages
- Consistent product quality

# Why They Joined Us?

We are excited to be part of UniversalAutomation.org because it promises to be a complete game changer. It opens up a new world of possibilities for organisations like ours. Unlocking valuable data currently buried in proprietary systems, making the connectivity and deployment of new technologies like Artificial Intelligence quick and simple. **As part of UniversalAutomation.org we are actively collaborating with and supporting like-minded organisations to create an exciting new open era in operations and automation.**

**Valeriy Vyatkin**

*Professor of Electrical Engineering at Aalto University*

**ADVANTECH**

*Enabling an Intelligent Planet*

Advantech is growing really fast and I believe if you want to keep on growing in the future, you need to be able to innovate. And when I see the universal automation approach, it is exactly the way of innovation we need to go with.

Who is inside Universal Automation? You have institutions, you have academics, you have OEMs, manufacturers and users. This means that you have **all the voices of the market on one platform**, no one is pushing in one direction. We are just finding the way to grow together to the next level.

**Universal Automation is really the concept you want to push today.** In the past there was one piece of hardware with one task, but we have to move on, we have to evolve. The evolution is that the hardware can have different kinds of software and everything can run on top of it. The hardware itself is not so important anymore.

**Marco Zampolli**

*Industrial IoT Product Sales Director*

I think now is a great time to disrupt the industry, really **become hardware agnostic** and let the end user decide what hardware they want to use.

Customers can basically choose the hardware they want using just one automation platform, so they become very versatile and are not bound to one particular vendor.

Universal Automation provides precisely the level of flexibility that a competitive and sustainable industry requires. For our customers, this is exactly what they are looking for today.

**Nicholas Holland**

*Managing Director - EMEA Broad Market*

# barbara

There is a huge room for improvement on the way runtimes are managed and orchestrated today. By joining UAO we aim to contribute to **make large runtime deployments more scalable and secure through modern Edge Management functions**. Our participation in UAO represents another significant step in our commitment to delivering **open and flexible solutions** based on industry standards, enabling industrial organizations to innovate more rapidly and with reduced risk.

**David Puron**

*CEO and Co-founder at Barbara*

We joined UAO because we strongly believe that we have to **decouple the application from the hardware**.

The value of our automation is not in the hardware and (yet today) we design every plant in hardware-centric way. That is no longer possible with the regional complexities of cyber security, more maintenance, more complex software requirements. On our current path towards Industry 4.0 that hardware-centric approach no longer good. So in short, we must decouple hardware & software to make sure that we are able to survive as an industry in Europe.

**Dominic de Kerf**

*Plant Systems and Controls COE*

On our hydroelectric power plants, we have technology from the 1950s that we need to modernize it. UAO's technology will allow us to **decouple software from hardware** and create **portable libraries of functions to replicate across our assets, independent of the automation hardware.**

We want to completely change our approach, focusing on functions rather than hardware constraints. This functional approach from design to implementation is a revolution for us.

Our automation teams were quickly impressed with this new approach and have understood it very quickly.

**Laurent Bacon**

*Head of Industrial Information and Control*

The creation of UniversalAutomation.org is the dawn of a new era within automation technology; over the course of the next five years, it will create a sea change for the future of automation software development. We are delighted to be a part of UniversalAutomation.org, driving the **development of a “plug and produce” system** which will help the industry keep up with the increasing demands of **flexible manufacturing**. There is no doubt that as members continue to join the organization and reap the benefits of collaboration and openness, that industry-wide change will follow.

**Dmitrii Drozdov**

*Chief Technology Officer at Flexbridge*

Open Automation technologies like UAO's will allow us to deliver innovative automation systems **faster** and at **lower cost**. That enables more **efficient manufacturing** and **faster time to market** for green solutions. We plan to start using IEC 61499 to innovate on top of existing infrastructure and technology as our first use cases. Longer term, more efficient integration of technology from different OEM machine and automation suppliers will have a major positive impact.

To those considering joining UAO, don't join if you like being locked into expensive proprietary PLC platforms and enjoy using the same old thing!

**David Campain**

*Global Product Manager, Process Control Systems*

I joined UAO because by being open, by being an international standard, by being already supported by quite a certain number of relevant companies, it paves the way for a new generation of not just automation systems, but a **new way of conceiving automation systems**. Because in the end it leaves behind the problem of hardware and unleashes the power of software, which has not yet happened in automation.

**Franco Cavadini**

*Chief Technical Officer*

KONGSBERG

I like to have a system that is based on an open standard instead of a system that is defined by just one vendor.

So for us, 61499 is one way of opening up our system and make it future ready and that's why we joined the UAO.

Today there are a lot of obsolescence issues in in the industry so you can end up in a corner where it's hard to move out from. Instead, **by using an open standard, you're having the opportunity to select the best vendor.**

A standard is always good but it's even better to also have an implementation of a standard. And that's exactly what UAO provides.

It's not an open-source, but a **guarded-source-community**. And that's very important because then there is **someone behind it to make sure that the quality of the software is good.**

**Sølve Raaen**

*Principal Architect OT*

When we came to UniversalAutomation organisation, they offered us a stable solution with the IEC 61499 standard as the future of open automation. This **standard eliminates the need for code conversion**. This means that customers can use only **one programming for our PLCs on different machines**. This also helps them to increase their efficiency, reduce their costs and run more stable machines.

We are very optimistic about our cooperation with Universal Automation because there are so many different types of machines and PLCs in China, and it takes a lot of engineering to make different machines talk to each other. We joined this ecosystem to make every machine and PLC talk in one standard.

In fact, we are the first local company in China to offer large scale IEC 61499 compliant hardware.

**Raphael Xiong**

*Sales Manager*

**THE STRONGEST LINK.**

We want to have an open system because our customers ask for it. It will also make our life much easier if there's only **one product with one interface that basically works with every controller.**

You can run the application on our system. You can also use another system. You can mix and match different systems. So literally a part of the system can be installed here and the other part can be installed in Australia and it will work together.

Most of our customers in process automation are pretty conservative, they never want to change a running system. But now, we see a new generation coming up that is used to new technologies. They are open to test and try these new functionalities and I think most of them pretty well understand the advantages on this. I'm doing this for 20 years now and I think over the years, this is the most exciting change.

**Andre Fritsch**

*Senior Product Manager*

The change to Universal Automation is really enabling the industries of the future.

Business data, coming from the automation level, is the foundation to make much more conscious decisions. Universal Automation is an ideal prerequisite for efficiently obtaining this data and performing valuable analyses.

Universal Automation of course is much closer to the IT-thinking and therefore young talents are more attracted to work in this environment.

**Barbara Frei**

*Executive Vice President Industrial Automation*

Stratus, a proud member of UniversalAutomation.org, is committed to advancing open, vendor-independent automation. By creating open ecosystems, UniversalAutomation.org enables users to choose the **best hardware and software combinations for optimal performance**. The Universal Automation Open approach allows users the ability to pair their software with a hardware platform that brings **reliability, security, and simplicity** to the forefront. With built-in virtualization, OT supportability, high availability and fault-tolerance, Stratus platforms enable users to deploy UAO projects with confidence in their mission critical operations. By aligning with UniversalAutomation.org, Stratus empowers businesses to scale, innovate, and accelerate time to market with reliable, secure solutions across multi-vendor environments.

**Rudy de Anda**

*Head of Strategic Alliances*

We operate several thousand third-party installations, so we find ourselves with a large volume of equipment from different brands. This requires great complexity of skills to maintain them. This is why the association's approach interests us greatly: to **simplify the multi-vendor complexity**. Pooling the skills of our employees on a limited number of platforms is a guarantee of operational efficiency, and a vector of success for the dissemination of standards.

**Michel Arroyo**

*Operations and Performance Director*

# wood.

Wood is excited to be part of defining the future of automation and transforming profitability and productivity for the customers in our industrial markets. UniversalAutomation.org technology will enable business innovation, increase digital adoption and agility with its **open, interoperable** and **portable solutions- building business resiliency** and empowering our clients to be future-ready.

**German Carmona**

*Global President of Wood's Digital Consulting business*

# UAO as Technology Enabler

# UAO is an accelerator of other open standards

Implementation of standards using proven-in-use software components

UAO Library components accelerate  
implementation of open standards

OPAF library

Universal  
automation device  
Vendor 1

Universal  
automation device  
Vendor 2

Universal  
automation device  
Vendor 3

OPAF/UAO Liaison Agreement already effective

# UAO is an accelerator of other open standards

Implementation of standards using proven-in-use software components

Defines Dosing Service

**UNIVERSAL**  
AUTOMATION.ORG

Implements “Dosing” as a  
software component

## BENEFITS

Test “Dosing” software component once (vendor independent), run on multiple UAO devices.

- Lower engineering cost
- Faster commissioning
- More reliable (Proven-in-use components)
- One software environment to learn

Execute “Dosing” on UAO devices  
UAO device = MTP-compliant device

# Benefits

## Driving Significant Benefits for...

### Users

- **More cost-effective** – write once, re-use regardless of vendor
- **More reliable & safer** using proven-in-use, reusable software libraries
- **Incrementally improve** over the lifecycle
- **End-of-life proof** - re-use software, even when automation hardware is obsolete
- **Embed & reuse IP** to protect competitive edge or to get better ROI on increasing software investment

### Vendors

- **Grow software revenues**
- **Access new end users/segments** with new offer
- **Shape state-of-the art software technology**
- **Decreased costs/risks** thanks to platforming

# Why should END USERS join UAO?

UNIVERSAL  
AUTOMATION.ORG

**Network** with other members to learn, exchange and collaborate

**Get your employees trained** on the technology

**Be invited to world-leading industry events** on behalf of UAO to share your unique Point of View

**Be invited to exclusive live events** to network with other industry leaders and relevant thought leaders

**Leverage UAO's network and community** to advance your business goals

**Sponsor the initiative**  
Without users we will NOT attract vendors

**Influence** the next development of the runtime execution engine

# Why should SIs/EPCs join UAO?

UNIVERSAL  
AUTOMATION.ORG

Get access to key **End Users & Projects**

**Get trained** on the technology

**Embed your knowhow/IP** in software component libraries

**Be promoted** by the association (social media, webinars, fairs...)

**Be invited to world-leading industry events** on behalf of UAO to share your unique Point of View

**Be invited to private events** to network with other members and relevant thought leaders

**Promote your experience and skills within the community**

# Why should **VENDORS** join UAO?

**Obtain license** for UAO runtime execution engine - **create a new category of automation device** in months rather than years

**Share R&D costs** with platforming approach

**Influence** the next development of the runtime execution engine

**Get access** to key End Users looking for IEC 61499-based systems

**Position** your company as thought-leader/innovator

**Be invited to world-leading industry events** on behalf of UAO to share your unique Point of View

**Be invited to private events** to network with other members and relevant thought leaders

**Promote your experience and skills within the community**

UNIVERSAL  
AUTOMATION.ORG

UNIVERSAL  
AUTOMATION.ORG

# Why should ACADEMICS join UAO?

UNIVERSAL  
AUTOMATION.ORG

**Stay up to date** with Next Gen automation systems Sponsor the initiative

**Network** with other companies & academics to learn & drive standardization

**Influence** the next development of the runtime execution engine

**Get trained** on the technology, interact with UAO Ecosystem

# IEC 61499 – Event Driven Function Block

- Self-contained SW component providing functions *thru defined interface*
- Programmed in any language
- Real-time + Right-time
- SFB: FB interface to functionality beyond IEC 61499, e.g. comms networks, device hardware, etc.

## Basic FB

e.g. Motor  
+ Execution Control Chart  
+ Algorithms (ST)

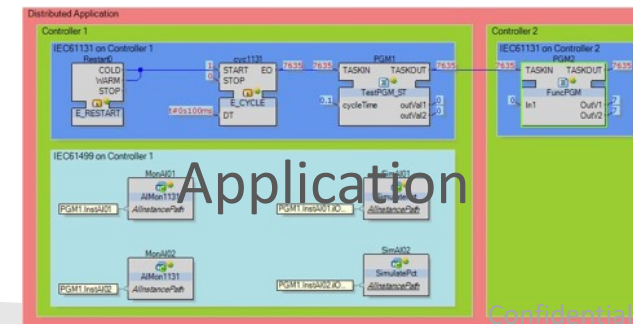

## Composite FB

e.g. Conveyor line  
Composed out of Basic FB,  
Composite FB, Service FB

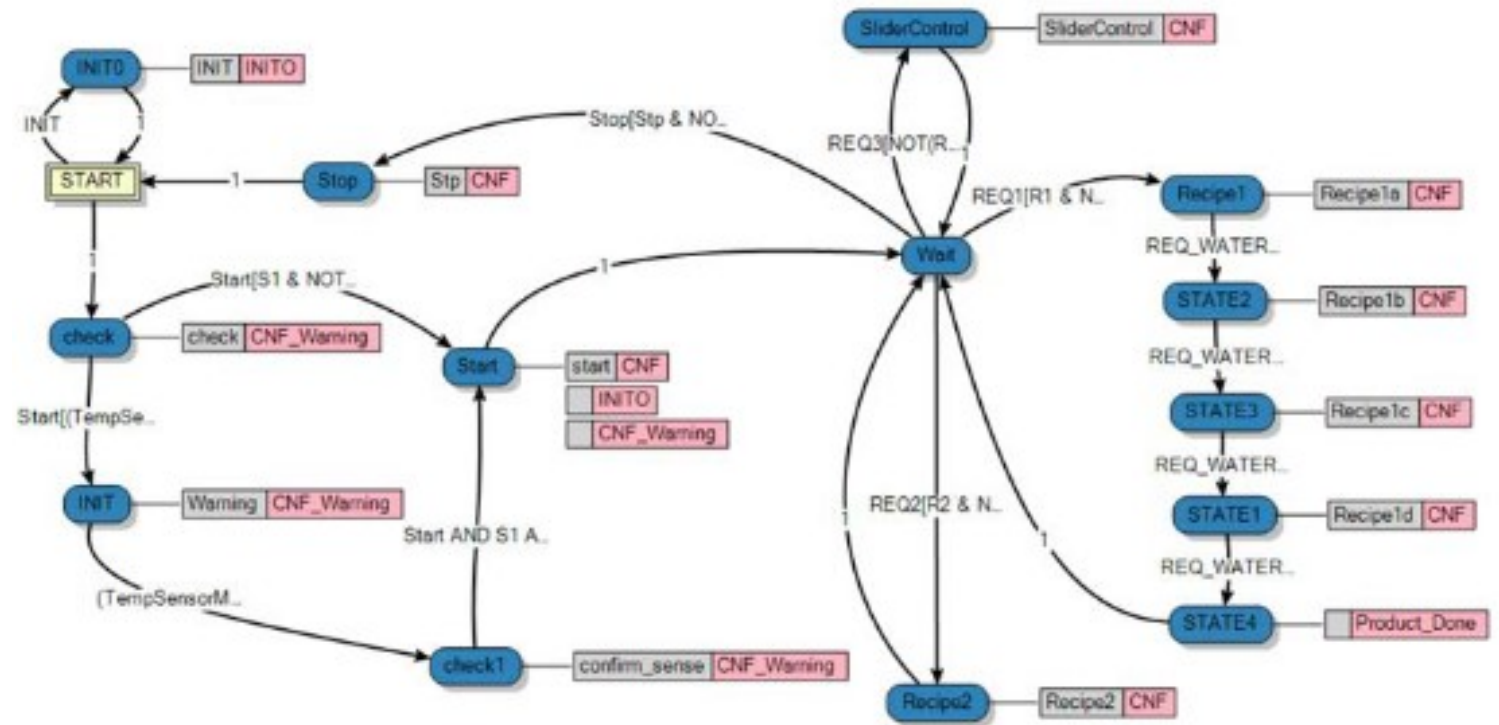

## Service FB

e.g. I/O access (Data, HMI,  
Communication ...)  
Provided by the System

# IEC 61499 – Execution Control Chart

- State-transition machine
- Structured approach to programming
- Small programs easy to read
- Debug & commissioning simplified

Example recipe controller (Valeriy Vyatkin)

# IEC 61499 – Adapters

Hide complexity with single line engineering

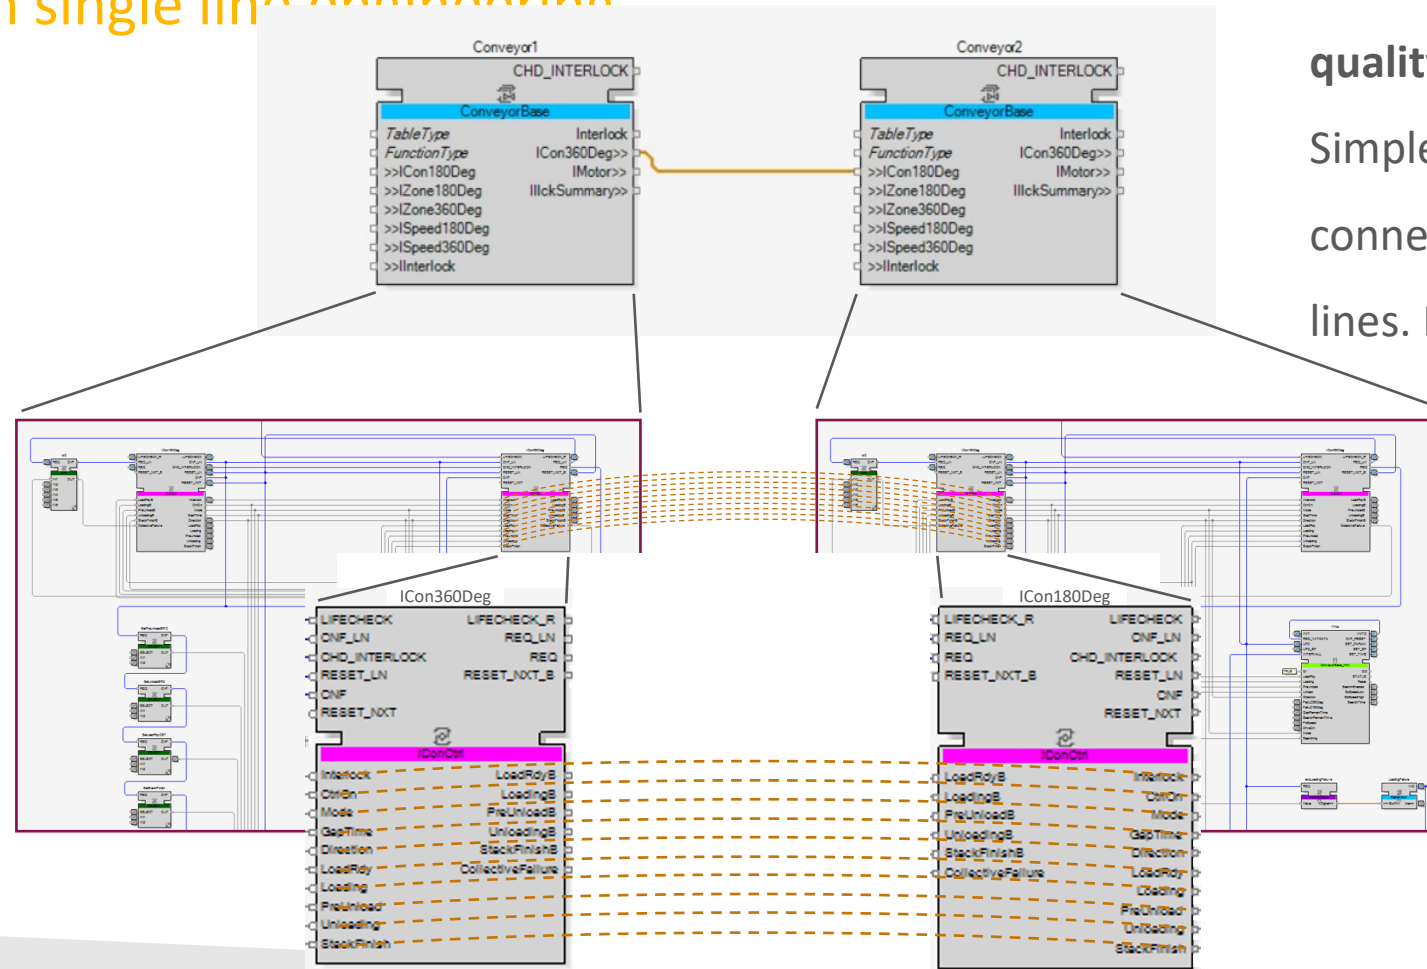

## Simplest Automation

A library concept hiding the complexity in engineering. Programming by simple but intelligent lines, helping to prevent failures.

Tremendous cost savings.

Simplest engineering possible enabling **savings** and **consistent quality**.

Simple **ready-to-use objects** connected together by simple lines. Forget events.

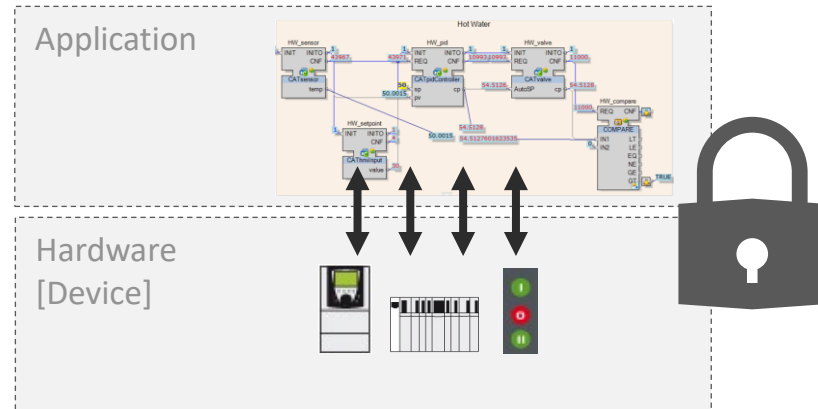

# IEC 61499 – Application and Device/Resource models

## Decoupling of Application software from hardware

- **Application Model**  
defines how to create  
application using FB  
networks
- **Device/Resource**  
models define the  
compute resources on  
which the application  
will execute

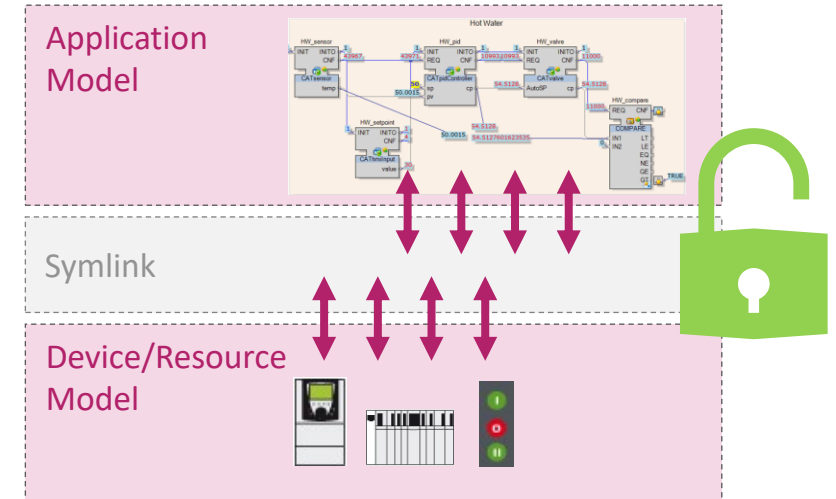

**Today**  
**Hardware & Application**  
is tightly linked

- Reusability is difficult
- Late modifications are challenging and costly

**Tomorrow**  
**Hardware & Application**

is completely independent due to Abstraction

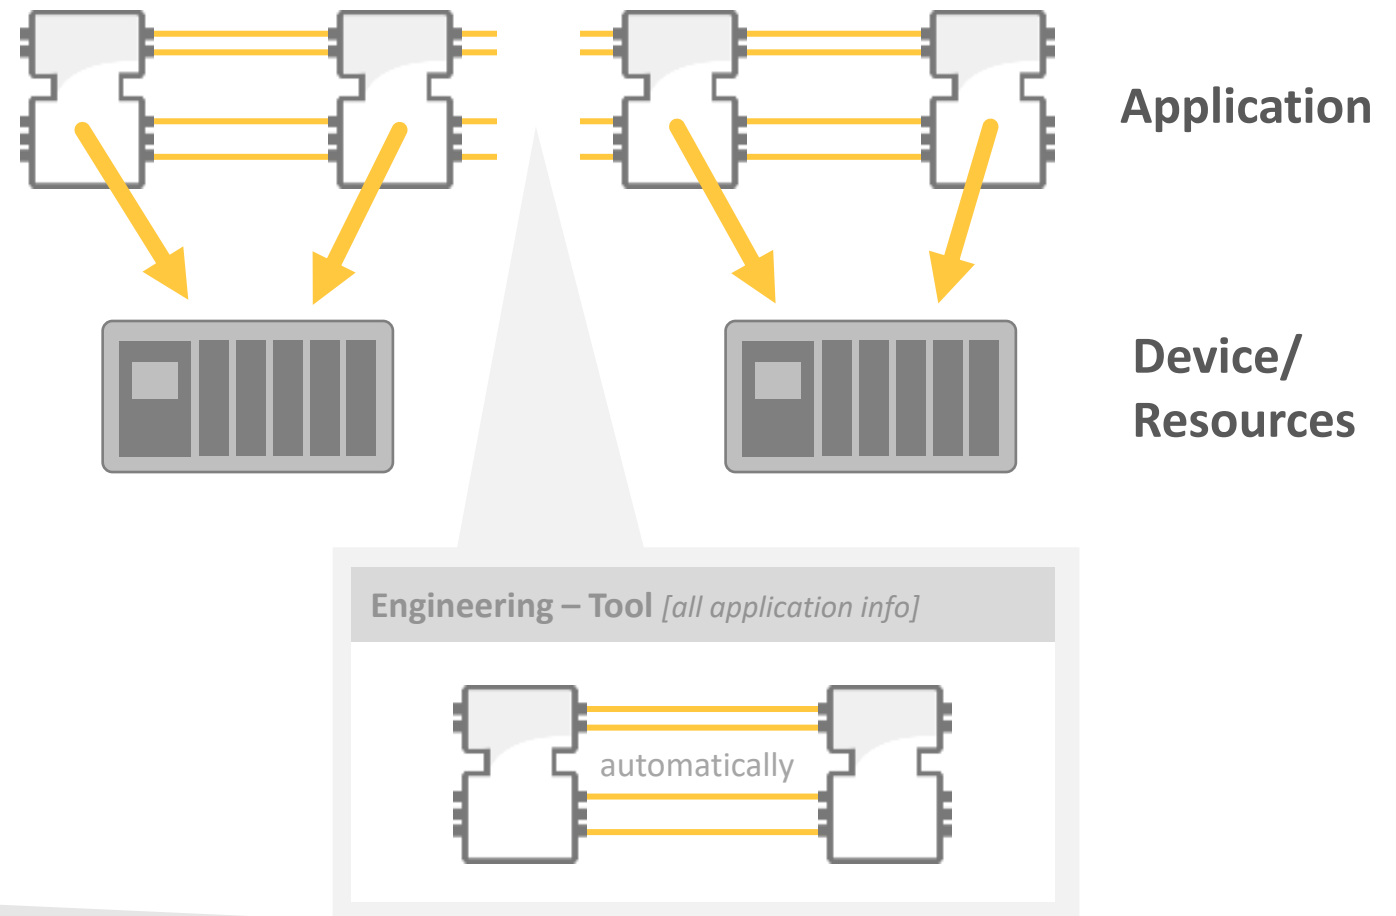

- Create applications without  
considering the HW where it will be  
deployed
- Link application and hardware at the  
latest possible time in the project  
schedule

## IEC 61499 – System Model

### Mapping of FB's to Device/Resources

- **System model** maps FB's to hardware on which application will execute
- **Event-driven** structure allow automatic establishment of comms paths across networks

## Shared runtime execution engine

**WE  
are**

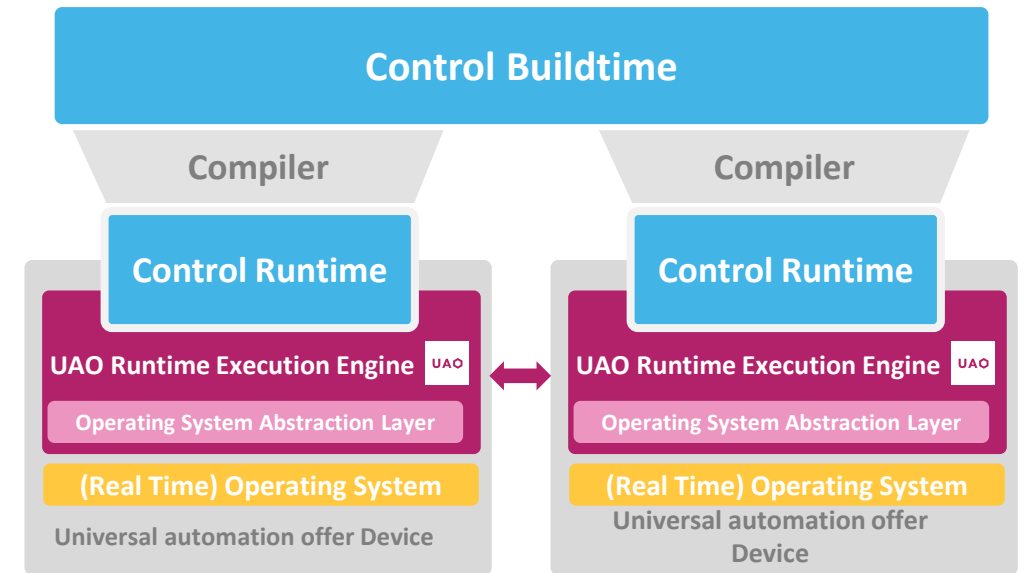

A community of users and vendors organized around an independent non-profit association

**WE  
use**

UAO-compliant platforms that use a **shared-source IEC 61499 runtime execution engine**

**WE  
promote**

**Portability/Reusability** of vendor-independent automation application software

- Initial source code contribution from Schneider Electric
- Member contributions will shape the technology moving forward
- **Common IP Policy** to ensure single RT, manage member contributions & protect member interests

# Plug & Produce SW Components: The Missing Link for Industry 4.0

Proven-in-use software  
components (automation  
apps)

Integrated Development  
Environment for IEC61499  
application  
“BuildTime”

Distributed control HW with  
embedded “RunTime”

“Plug & Produce”

“Write once, distribute across UAO-compliant devices”

## Today

Low value proprietary applications

|                |  |
|----------------|--|
| Costs          |  |
| Time to Market |  |
| Flexibility    |  |
| Quality        |  |

## Tomorrow

High value portable apps

|                |  |
|----------------|--|
| Costs          |  |
| Time to market |  |
| Flexibility    |  |
| Quality        |  |

## Flexible Architectures: Centralized to distributed

- Distribute the control logic of a complete system to several controllers by drag & drop
- Automatically generated cross-communication
- Late-binding
- Distributed, centralised or hybrid

Centralised – edge computer

Distributed Control Nodes

# Asset Centric Automation-Modular machine/process

## Master complexity

- Representing real devices as ready-to-use software objects, encapsulating all their aspects - Building block for CPS.
- Complexity hidden from users.

## Efficient engineering

- Using proven-in use library instances
- From process specification (P&ID) to detailed control program very quickly
- Maintain one software library Independent of control hardware
- Quicker commissioning

## Modular Machine Process

- Match control modularity with mechanical/electrical modularity
- Expand by adding modules

## Embed IP/know-how libraries

Single line engineering with adapters

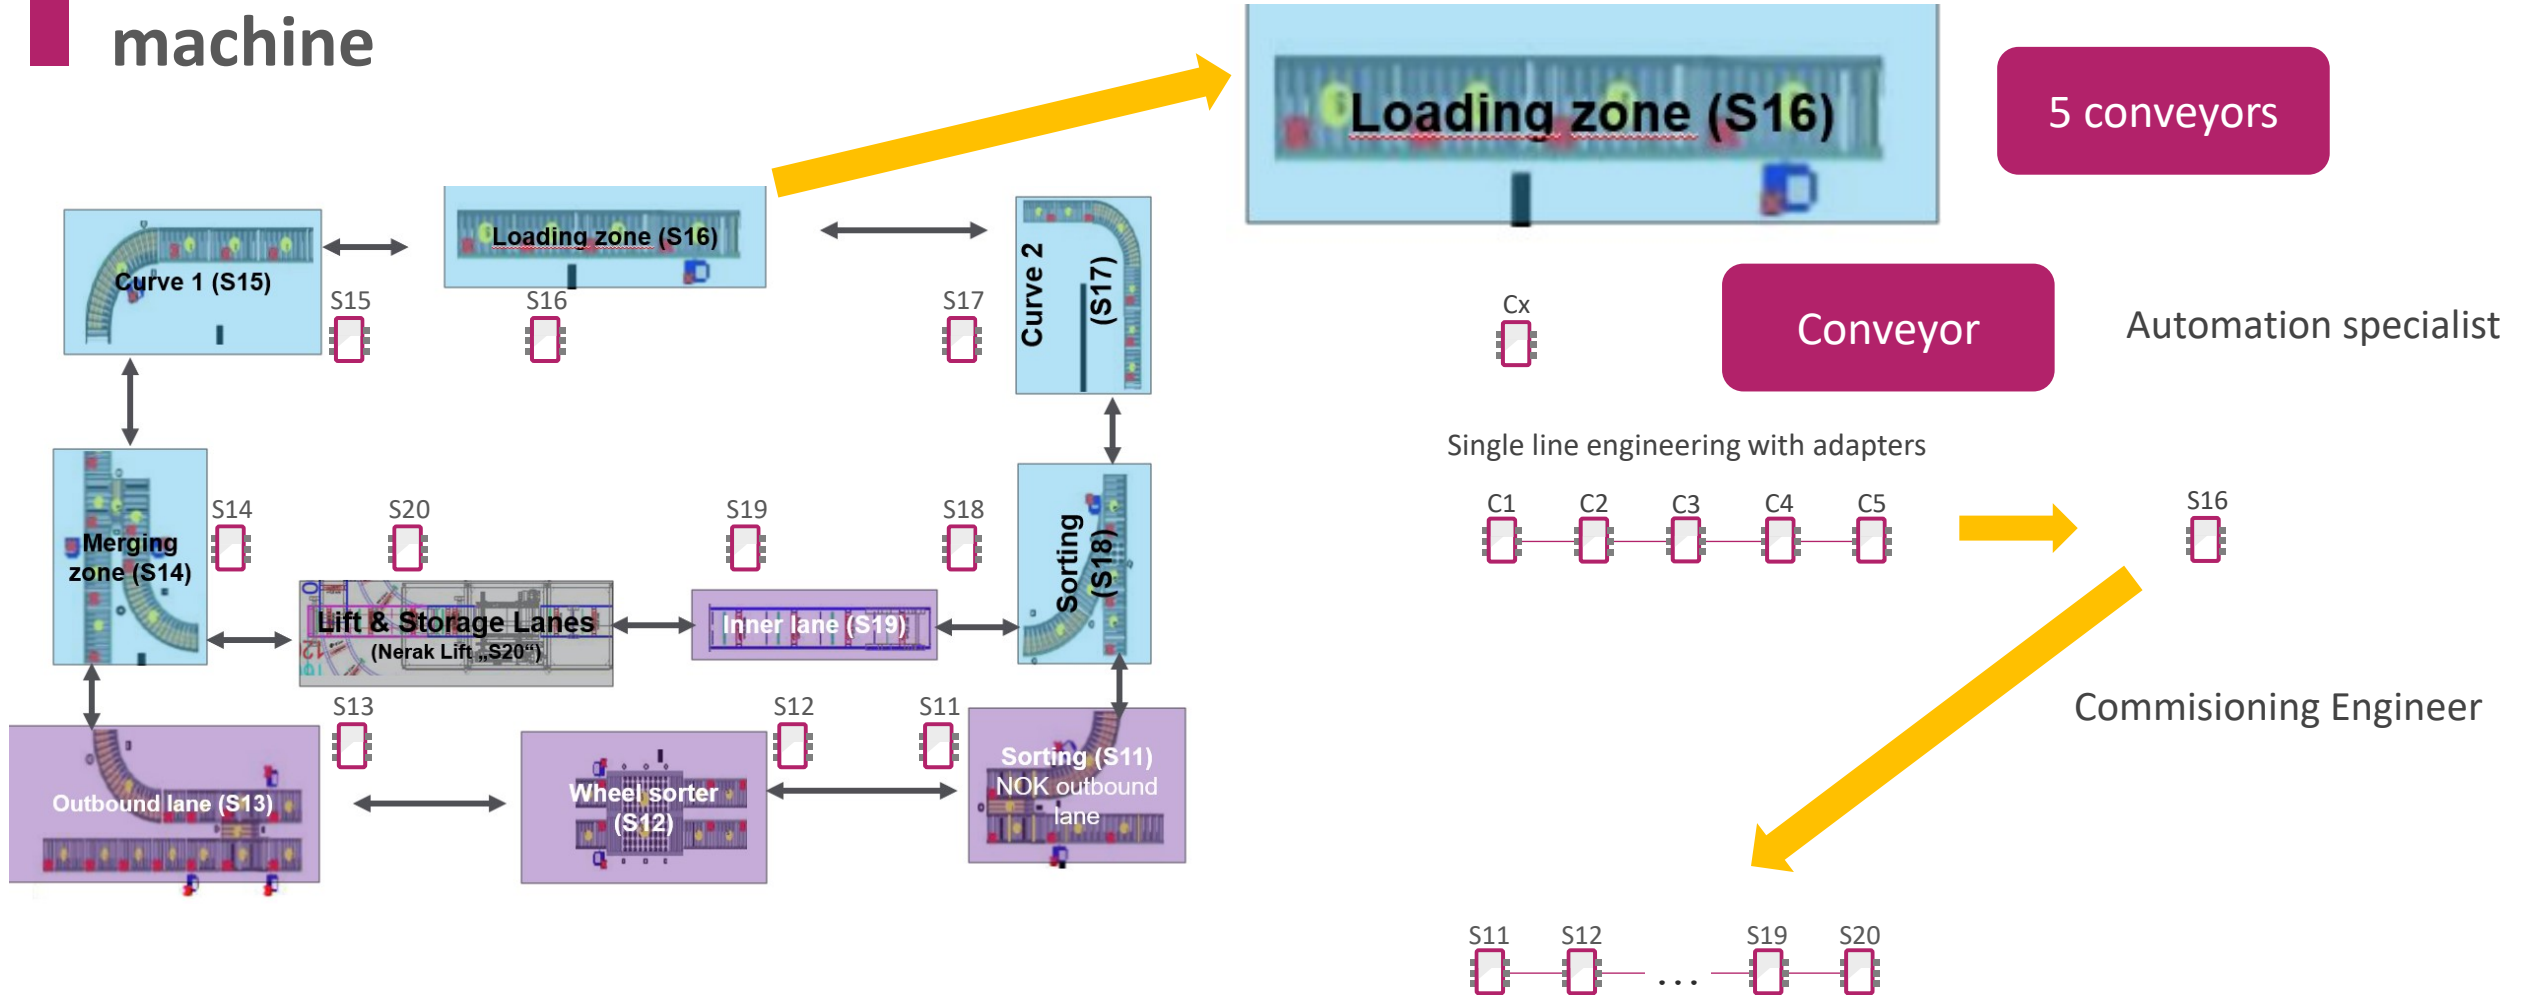

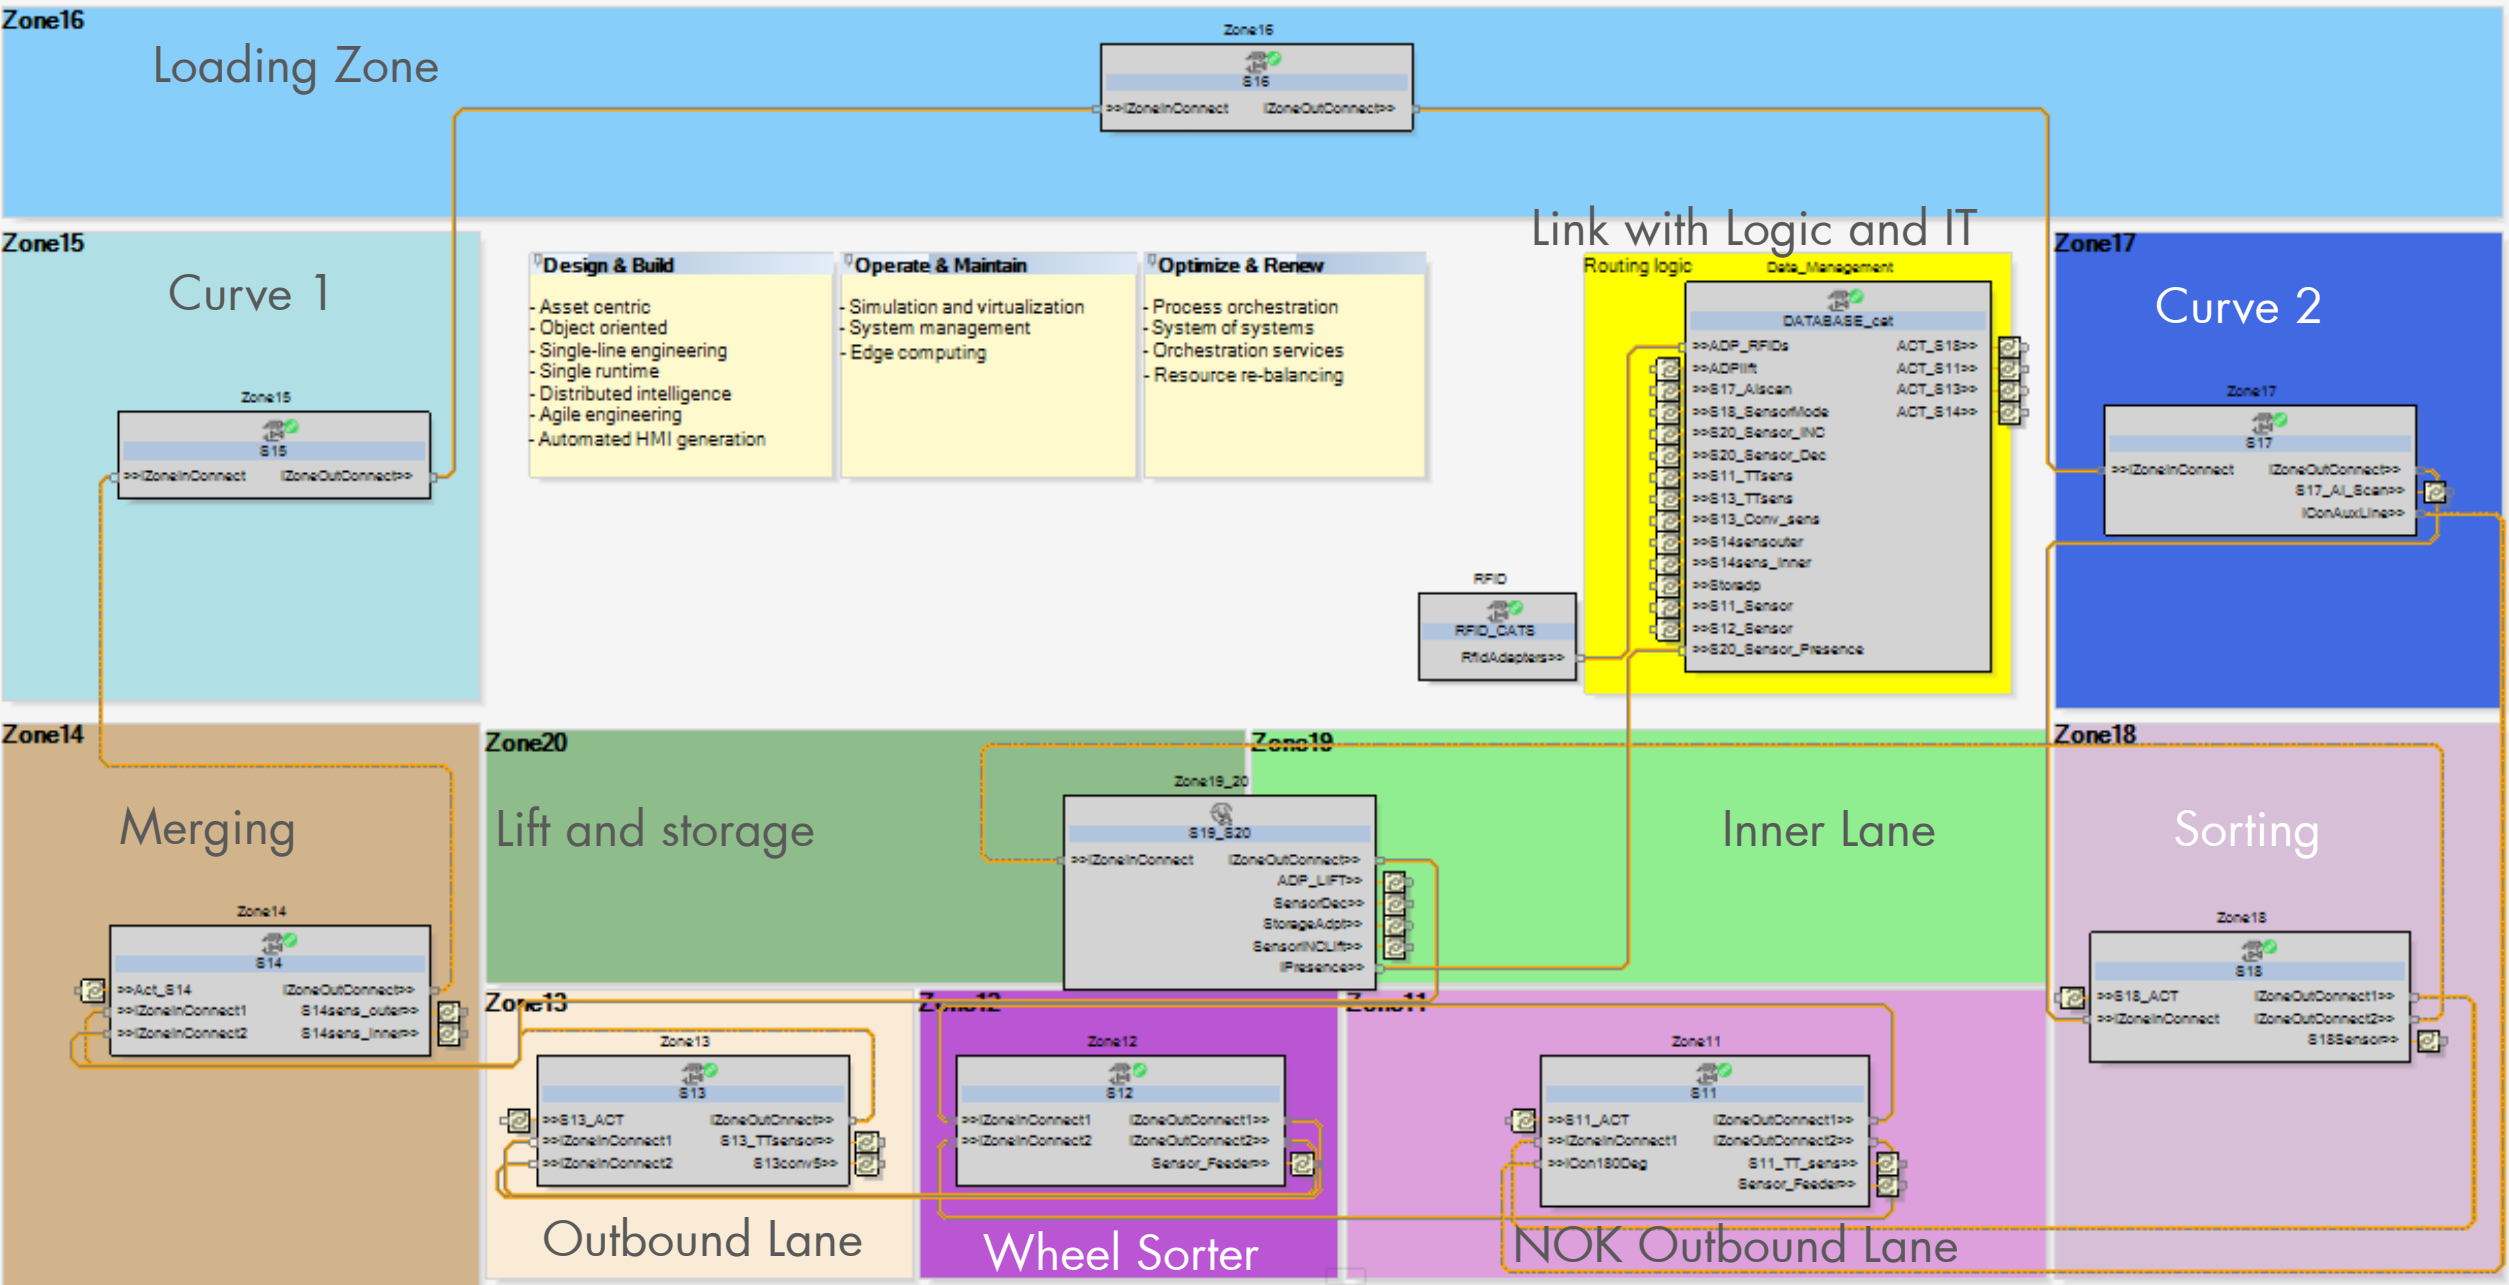

Process Engineer  
Commissioning

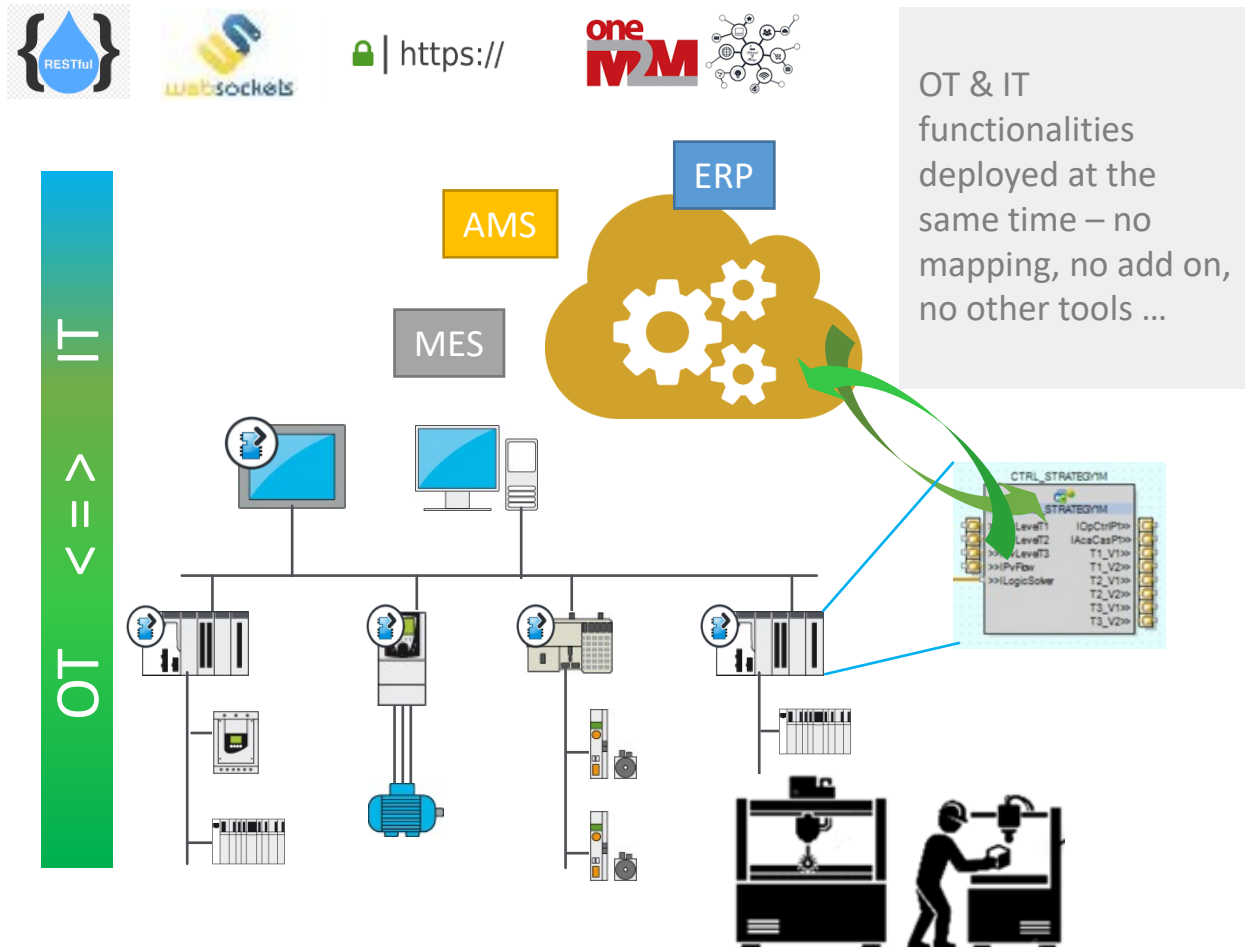

Automation specialist

# Asset Centric Automation-Modular machine

# IT/OT Convergence

## Utilizing well known and accepted IT concepts, practices & standards

### Same concepts:

- Event driven execution
- Methods with parameters
- Service oriented & blackbox design

### Usage based connectivity:

- Register and establish connectivity when needed
- Close connection/unregister when done

### Use cases:

- Query/update datasets from IT level
- Connection to MES, ERP, AMS ...
- Trigger tickets in CMMS, provide root cause information ...
- Multi-level & shared control strategies (Cloud, Fog, local)
- Enabler for
  - Decision support/process optimisation, autonomous operation
  - Pay per use services/control strategies

# Wrap & Re-Use/Orchestration

IT

## Engineering

## Operations

OT

Existing installed base

- Legacy Equipment
- IEC 61131 controllers

## Two main orchestration use cases

1. **Close coupling IT and OT systems** to implement Industry 4.0 Use Cases, e.g., Digital Twin
2. **Application orchestration** of complete process or multiple machines (additional OT functions)

KONGSBERG

- Pipeline leak detection
- Well test automation
- One Button Startup

# Reference Examples

# Vendor-independent Plug & Produce Software Components

## Segment - Oil & Gas Refining: ExxonMobil

## Challenge

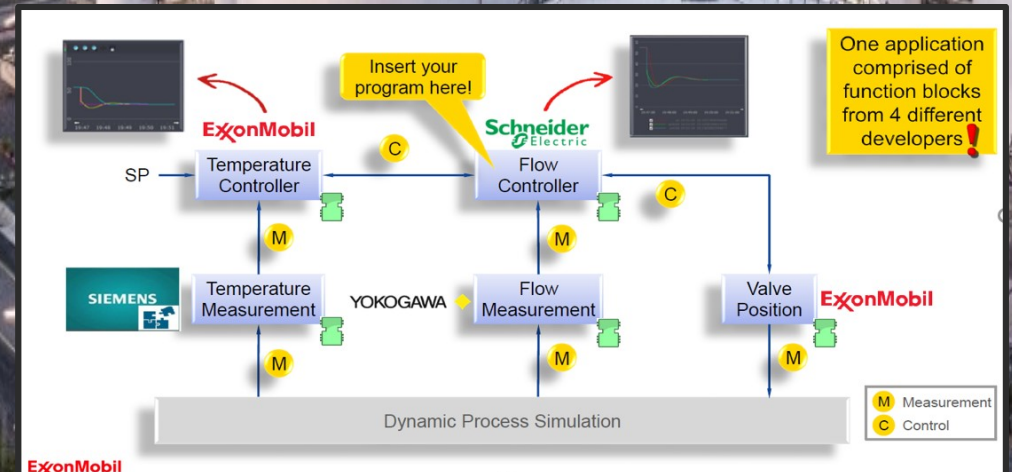

I would like to build my **application using best-in-class software components** from **different suppliers**.

## Solution

ExxonMobil research published an IEC 61499 adapter interface for PID control and asked their suppliers to provide components using the adapter. XOM were then able to program a cascaded control loop using different blocks from different suppliers in a Plug & Produce fashion

## Benefits

- **Reduce engineering time** & shorter commissioning using proven-in-use software
- **Increased innovation** using best-in-class software components
- Continuous improvement enabled by swapping out existing components with improved ones sharing the same adapter interface.

# Vendor-independent Plug & Produce Software Components

**Segment** - Waste Treatment – Royal HaskoningDHV

## Challenge

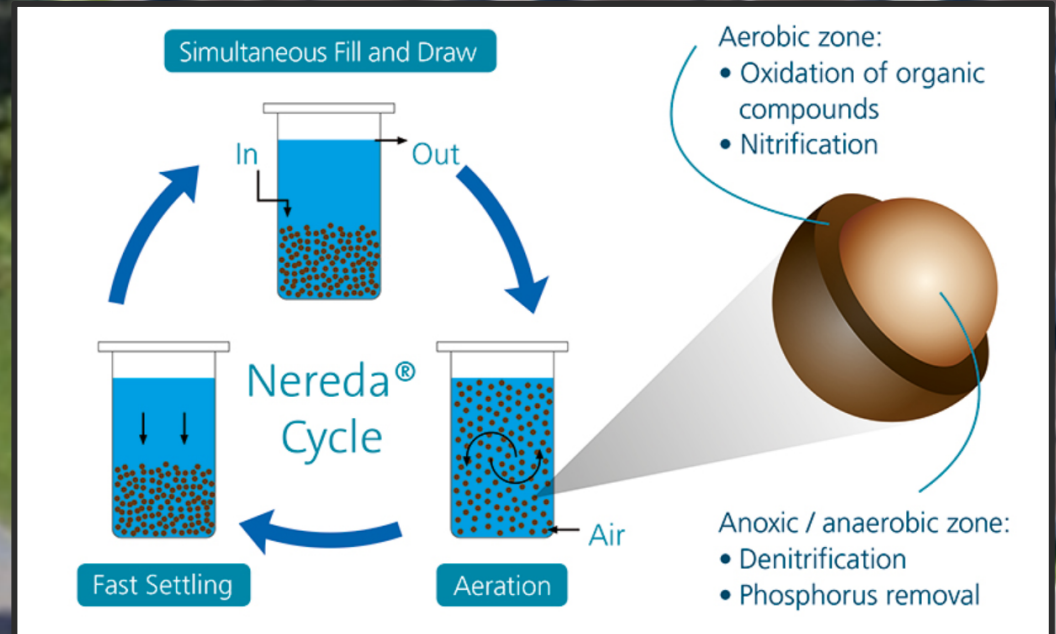

AquaSuite Nereda Controller, a smart, integrated process controller for Nereda for waste-water treatment requires easy integration to the real-time control systems

## Solution

A library of IEC 61499 software components to easily integrate with the PC-based Nereda controller

## Benefits

- **Reduced engineering time** & shorter commissioning using proven-in-use software library
- The promise of **vendor-independence**

# Flexible Architecture

## Vendor independence

### Segment - Mining

#### Challenge

- Many variants of the same machine due to Machine options requiring hardware/software changes
- Final end users asking for specific brands
- Complexity and costs along life cycle (construction and maintenance of the machine)

#### Solution

- **Standardize** application software
- PC based automation for **scalability** (Linux)
- **Free to select hardware** matching end user specifications
- Orchestration of installed based for retrofit

#### Benefits

- Division by 3 of number of variant per machines (ca. 250k EUR/year savings)
- Scalable controller, change simply CPU and RAM

# Flexible Architecture

## Vendor independence

### Segment – HVAC – Industrial Air Cleaning

#### Challenge

- Aggregation of many technologies to address a large scale of machine variants
  - Small to medium PLC / Homemade control
- Huge level of modularity
  - 1 to N fans / 1 to N dust handling or cleaning systems
- Sell added value service for machine process and energy consumption optimization

#### Solution

- From VSD to small PLC to IPC
- Asset library to easily manage
  - Machine modularity
  - Standardize application

#### Benefits

- Rationalize SW solution VS all machine variants
- Vendor independent

Combustible Dust

Oil Mist Filtration

Dust Collection and  
Housekeeping

Welding Fume Extraction

Wood Dust Collection

# Modular Machine Vendor independence

## Segment - Logistics – Automated warehouse 2

### Challenge

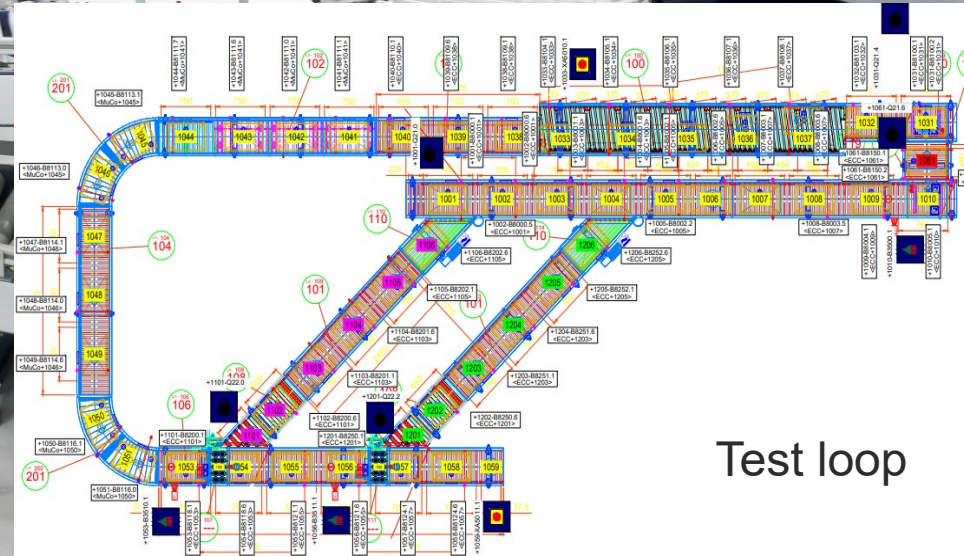

- Looking for multi source solution
- Optimize his production workflow to become more competitive
- Value add services to differentiate vs competition

### Solution

- PC based control + Distributed to variable speed drive
- OPC UA connection to existing Warehouse Management Syst
- Profinet to connect to existing field devices
- Asset application library

### Benefits

- Flexibility of choice of control solution
- Faster to design the application by reuse of functional unit models (eg conveyors)
- Easier to integrate diagnostic information's
- Easier to combine IT based added value services

Test loop

# Asset Centric Control Plug & Produce SW components

**Segment** – Mining – Mobile Stone Crusher Machine

## Challenge

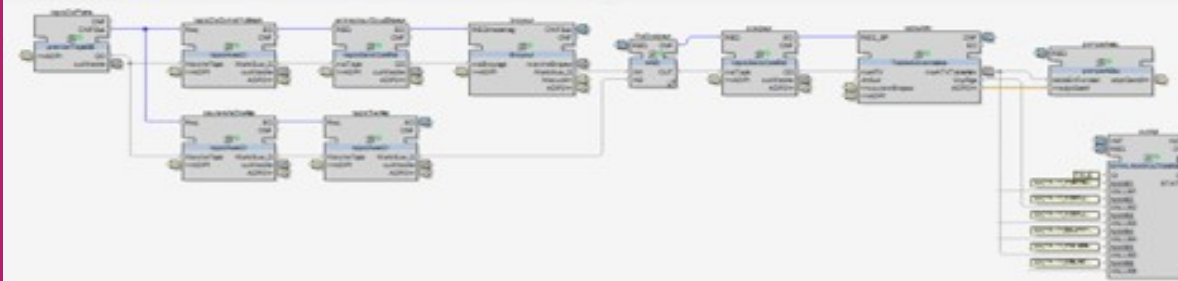

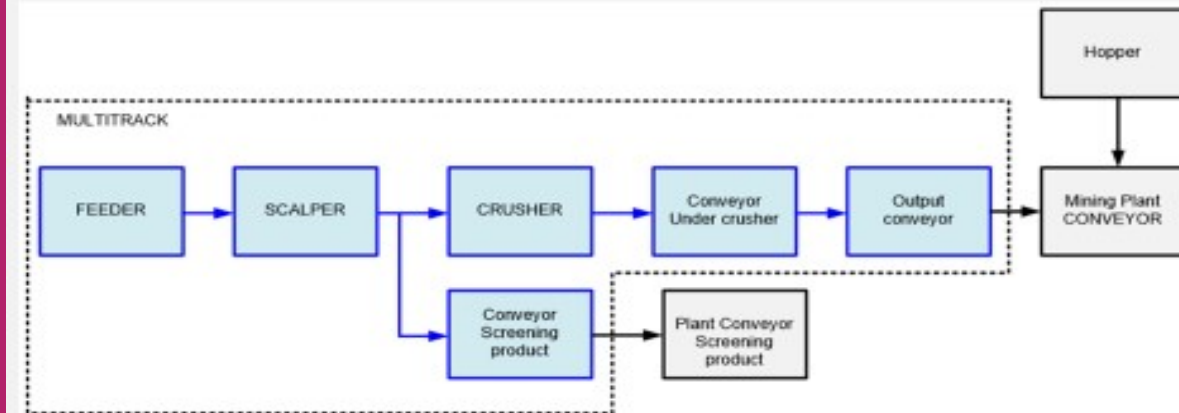

- Reduce Time to Market
- Better and faster fit to European Union Domain

## Solution

- Based on machine PLC with analog & digital IP
- Asset application library

## Benefits

- Faster to design the application by reuse of asset models

# Modular machine, IT/OT convergence

## Segment - Logistics – Automated warehouse 1

### Challenge

- Due to different requested shapes and performance, conveying systems require many variants.
- Usual solution is a central (large) PLC with multiple application code – however it is complex and expensive along lifecycle

### Solution

- Principle is to create different modules – each of them controlled by a simple PLC - an iPC bridges the OT (Soft controller & HMI) with the IT (AI, Northbound connectivity, Scada)
- Digital Twin solution simplifies the tests, visualization and the setup – allowing drastic reduction of the commissioning
- A specific AI algorithm is trained on Visual Inspection to perform quality control on the transported items

### Benefits

- Modular control system, no need to rethink application code
- Ease to scale up or down, reconfigure along lifecycle
- CapEx reduced by ca. 35% and downtime cut by ca. 25%

# IT/OT Convergence Wrap & Reuse

## Segment – WWW – Smart Plant

### Challenge

- Common platform for telemetry and process optimization of hundreds of plants
- Vendor independence of the solution
- Edge computing & Scalability

### Solution

- Barbara for high scale deployment
- IPC & containerized UAO Runtime

### Benefits

- Plant performance optimization by adding control strategies on top of the existing automation system
- Virtual Sensor (AI)
- Software based plc able to manage the update of the application using standard IT mechanisms

# Wrap & Reuse, Vendor Independence

**Segment** Consumer Packaged Goods – Master Systèmes – Sophim

## Challenge

- Modernize legacy automation systems to an Industry 4.0 solution in a managed, low-risk, and agile manner
- Clean integration of IT technologies, focusing on predictive maintenance
- Leverage external engineering expertise without introducing project or solution complexity

## Solution

- UAO runtime runs on a Linux iPC & PLC to manage the control (drives, actuators...)
- Dedicated software for CPG also runs on iPC

## Benefits

- Reduced design time and faster time to production
- Increased operational efficiency through maintenance improvements that enable rapid configuration of the system, reassignment of resources, and updates to human and machine interfaces
- More flexibility in the choice of automation platforms, and easier integration of analytics or other software solutions in the future thanks to the edge computing capabilities

*“This is a game-changer for us. EcoStruxure Automation Expert’s advanced engineering tools will help us reduce the time to develop an application and supports easy integration of IT technologies, including predictive maintenance. This translates into faster time-to-market with an easier to maintain solution for our end users.”*

**Maurice Re, Automation Director,  
Master Systèmes**

# Wrap & Reuse, IT/OT Convergence

## Segment – Tobacco Industry – Aimirim & ASRock Ind

### Challenge

British American Tobacco faced operational inefficiencies in their manufacturing facilities, including frequent machine stoppages and inconsistent product quality.

### Details

ASRock Industrial collaborated with Aimirim to deploy an AI-driven solution. The AI agents provided instant, intelligent recommendations to address production inefficiencies, ensuring smoother operations and higher efficiency.

### Benefits

The implementation of ASRock's iEP-6010E edge AI device and Aimirim's Shaman software led to:

- Real-time process control
- Predictive maintenance
- Improved automation scalability
- Reduced machine stoppages
- Consistent product quality

# IT/OT Convergence

## Segment – Energy Efficiency – E2COMATION

### Challenge

The E2COMATION project aims to optimize sustainability and energy efficiency in the manufacturing industry through a comprehensive framework. This framework integrates various subsystems to manage and analyze energy-related data from production environments.

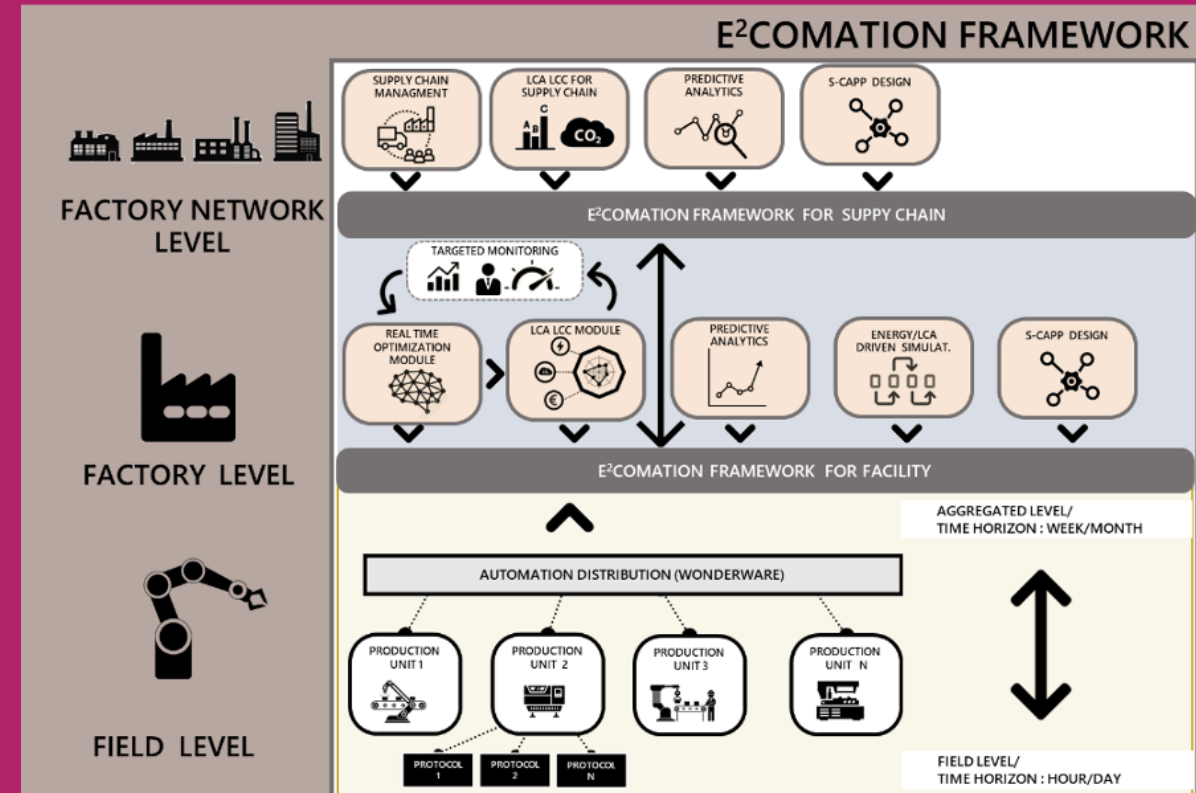

### Benefits

- **Energy Monitoring (EMon):** Collects and analyzes data from sensors.
- **MQTT Protocol:** Facilitates communication between devices.
- **APAMA Stream Analytics:** Analyzes data streams for performance forecasting.
- **Digital Twin:** Simulates and monitors production processes for optimization.

### Solution

The project leverages advanced tools and methodologies to enhance energy performance and sustainability in manufacturing.

*Funded by the European Union*

# IT/OT Convergence, Modular machine

## Segment – Discrete Manufacturing – MODUL4R

### Challenge

The MODUL4R project focuses on advancing manufacturing through robust and autonomous modular production lines and resilient supply chains.

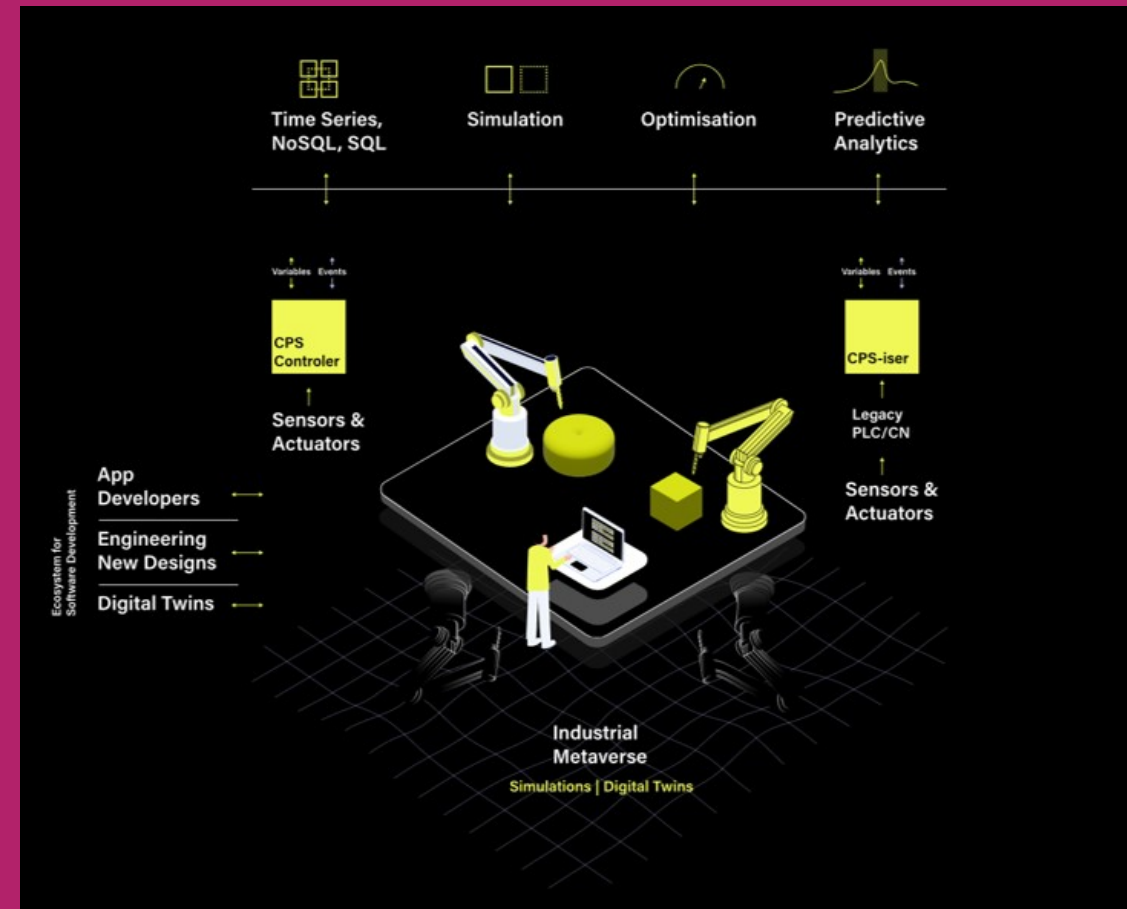

### Benefits

- **Resilience:** Adapting to changes in customer demands and supply chain disruptions.
- **Modular Technologies:** Enhancing flexibility in manufacturing operations.
- **Simulation and Interfaces:** Integrating with the Industrial Metaverse.
- **Human-Centered Technologies:** Upskilling workers for new manufacturing environments

### Solution

The project aims to support low-volume production and rapid adaptation to unexpected situations.

*Funded by the European Union*

# IT/OT Convergence, Vendor Independence

## Segment – MMM - METAWAVE

### Challenge

The METAWAVE project aims to revolutionize high-temperature industrial heating processes using microwave-based heating systems.

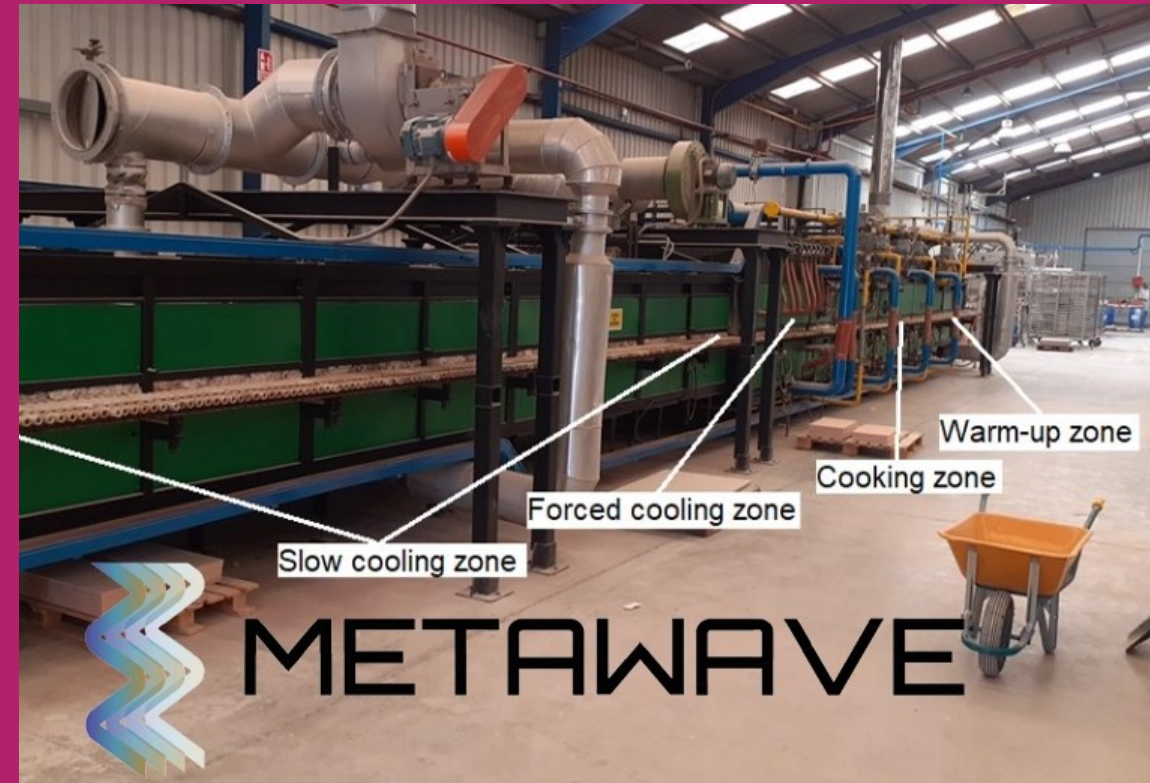

### Benefits

- **Efficiency:** Improving energy efficiency and reducing consumption.
- **Sustainability:** Lowering greenhouse gas emissions.
- **Productivity:** Increasing productivity through innovative technologies.
- **Integration:** Utilizing renewable energy sources and advanced digital systems for process optimization

### Solution

The project targets sectors like ceramics, asphalt, and aluminum, demonstrating the benefits of these technologies in real industrial settings.

*Funded by the European Union*

# IT/OT Convergence, Wrap & Reuse

## Segment – HVAC – Air Handling Units

### Challenge

The development of an application model to standardize the management and optimization of Air Handling Units.

### Benefits

- Can be used in both Brownfield and greenfield
- Vendor independent solution
- Encapsulation of main functionalities
- Scalable solution
- Reusability of the object and libraires created
- Fast integration & commissioning of new units
- Connectivity with IT models for data collection & optimization

### Solution

- IPC based solution with containerized runtime
- 10% more energy efficient
- 50% more scalable

# IT/OT Convergence

## Modular machine/ process

**Segment** – Consumer Packaged Goods

### Challenge

- Detect automatically wrapping defaults during process

### Solution

- Algorithm running on an iPC analysing images from camera connected to this iPC
- Machine-learning technology for detecting "good" and "bad" wrapping

### Benefits OEM

- Strong differentiations vs other OEMs
- New dimension for machine optimization
- Quality improvement – ensuring End-User satisfaction
- Financial gain – saving penalties from EU

### Benefits EU

- Waste reduction
- Avoiding non-conformity process

# Vendor Independence Wrap & Reuse

## Segment – Food & Beverages

### Challenge

- Control and manage the receiving and transferring of Soda to the factory
- Exchange data with different PLC manufacturers (Siemens and Rockwell) for manage and interlock the Soda transfer for each area of the plant. Also manage the Soda consumption for the area.
- Innovation and agnostic solutions to run on industrial PC, where in the future the control can be moved to the datacenter

### Solution

- UniversalAutomation.org runtime running in the Harmony iPC and Harmony HMI
- EAE runtime communicates with the third-party IOs and third-party PLCs to manage and control the Soda system.

### Benefits

- Breaking down automation silos, achieving greater efficiency and greater process safety.
- Developing a standard solution ready for the future that can be replicate in other factories

# Flexible architectures

## Vendor Independence

### Segment – Automotive

#### Challenge

- Frequent data interactions between subsystems and tedious communication interface programming are common
- Non-modular equipment design leads to repetitive tasks and higher error rates
- Traditional PLCs use closed protocols, making integration with enterprise systems costly and inefficient.

#### Solution

- Modular design improves program reusability
- Distributed programs manage the entire plant system, and a variety of IT interfaces provide flexible access to the upper system

#### Benefits

- Reduce downtime by 20% and save approximately 15% on maintenance costs
- Improved engineering efficiency by 20% through modularization and system level simulation
- Establish an asset library to standardize the engineering and application development process

# IT/OT Convergence Wrap & Reuse

## Segment – Carbon capture

### Challenge

- Find a mature open automation solution to move from initial PoC to a commercial demo plant

### Solution

- IEC 61499 with UniversalAutomation.org runtime
- Integration with SCADA & IT
- Drives included in scope of delivery

### Benefits

- Standard based solution
- High level of reusability in upcoming commercial plants
- Efficient upscaling

# Plug & Produce, IT/OT Convergence Flexible Architectures

## Segment – Mining – Hovering Solutions / Flexbridge

### Challenge

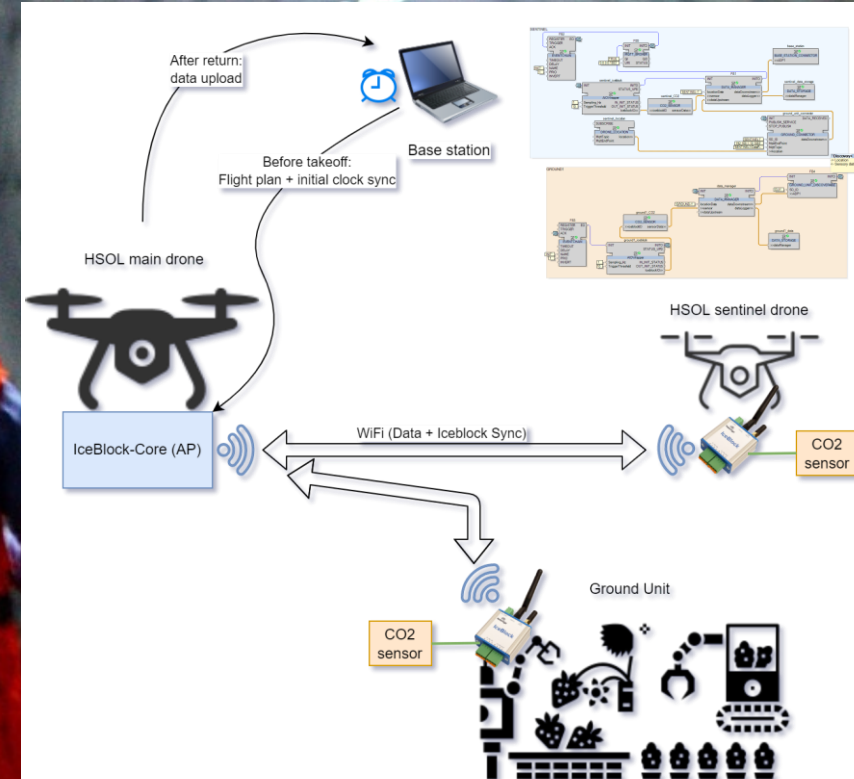

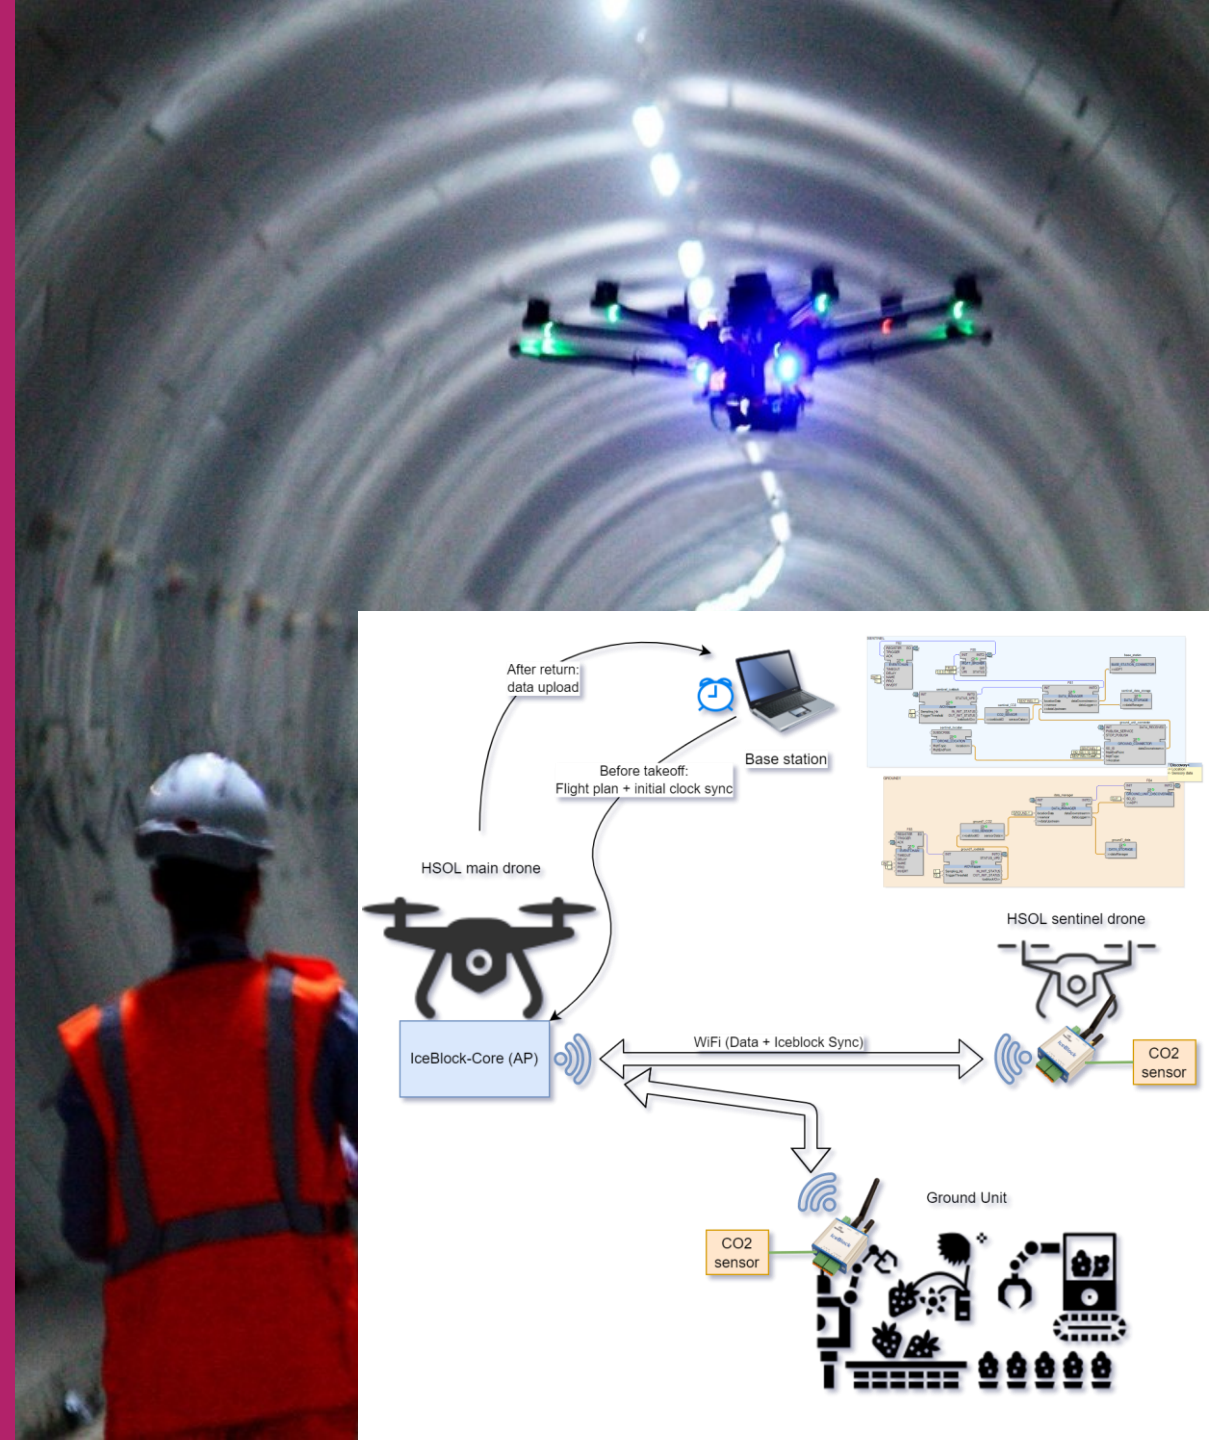

- **Challenging environments** hinder autonomous system deployment
- **Manual setup** is slow and error-prone
- **Real-time anomaly detection** and efficient data collection needed

### Solution

- **IEC 61499 + mDNS/MQTT** for auto-discovery and communication
- **Hovering Solutions drones** with IceBlock from Flexbridge linked with sensors for anomaly detection
- **Flexbridge's** application using IEC 61499 enables plug-and-produce and scalable deployment
- **Autonomous swarm** with localization and wireless communication

### Benefits

- **Real-time detection** boosts safety
- **Auto-discovery** cuts deployment costs
- **Faster data & missions** in underground operations

# Vendor independence, Flexible Architectures, IT/OT Convergence

**Segment** – Energy & Chemical - Exxon Mobil  
Open Process Automation Lighthouse Project

## Challenge

- Deploy an OPA System at a commercial operation to become vendor agnostic

## Solution

- Embed the UniversalAutomation.org runtime as one of the technology enablers for having an OPA System

## Benefits

- Reduce costs of at least 20% compared to traditional industrial control systems
- Improved efficiency and flexibility
- First facility operating OPA and embedding the UniversalAutomation.org runtime proving the functionality

# Kongsberg Maritime

# Wrap & Reuse Orchestration

## Segment - Offshore platforms – Kongsberg Maritime

### Challenge

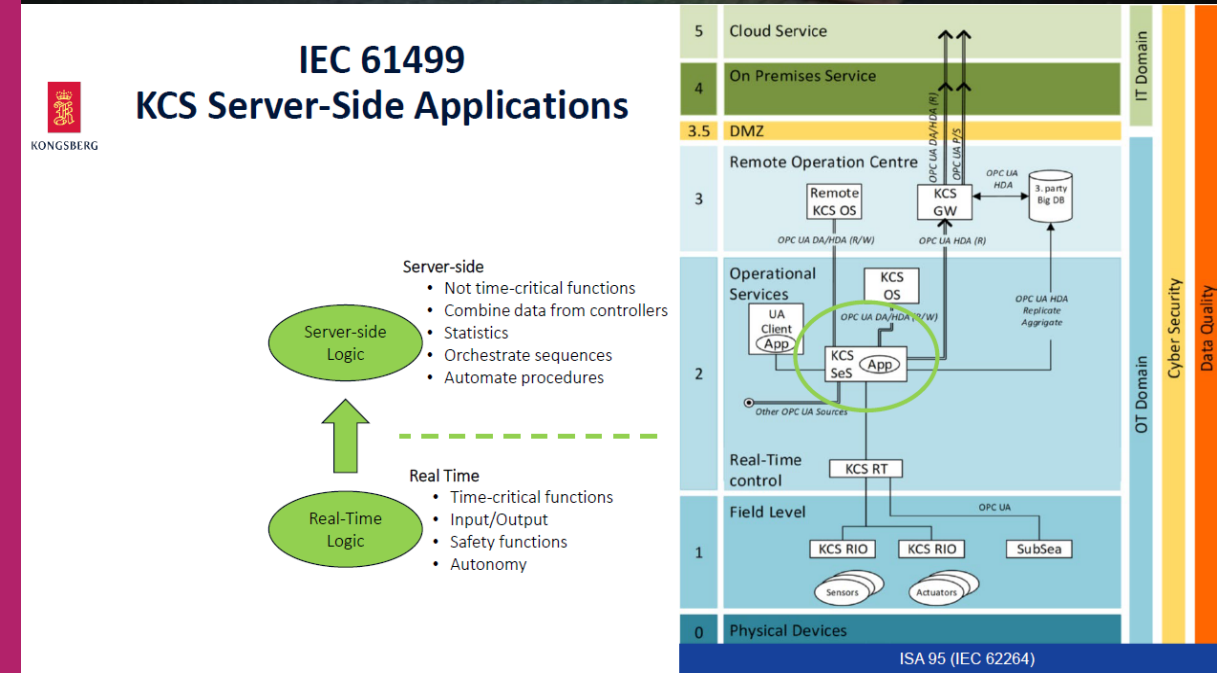

Legacy automation systems have limited capacity to support new functions, expansion.

### Solution

UAO runtime runs at server level above real-time controls

### Benefits

- Offload real-time legacy controllers to allow systems expansion
- Add new advanced multi-controllers automation functions without stopping running systems
- Automation complex operator procedures

# OBS – One Button Startup

## Start as by the most experienced operator

One Button Startup (OBS) describes the high level functions used to automatically start and stop systems/equipment without other operator intervention than

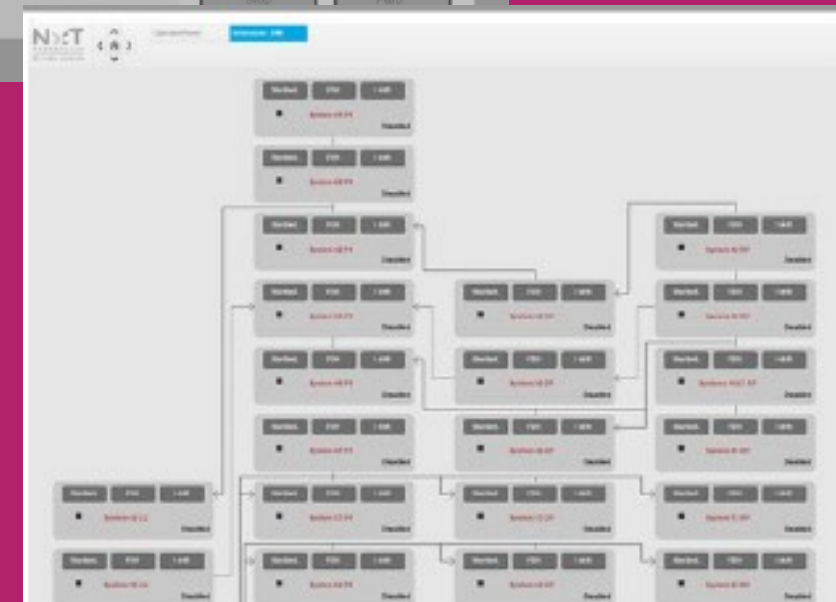

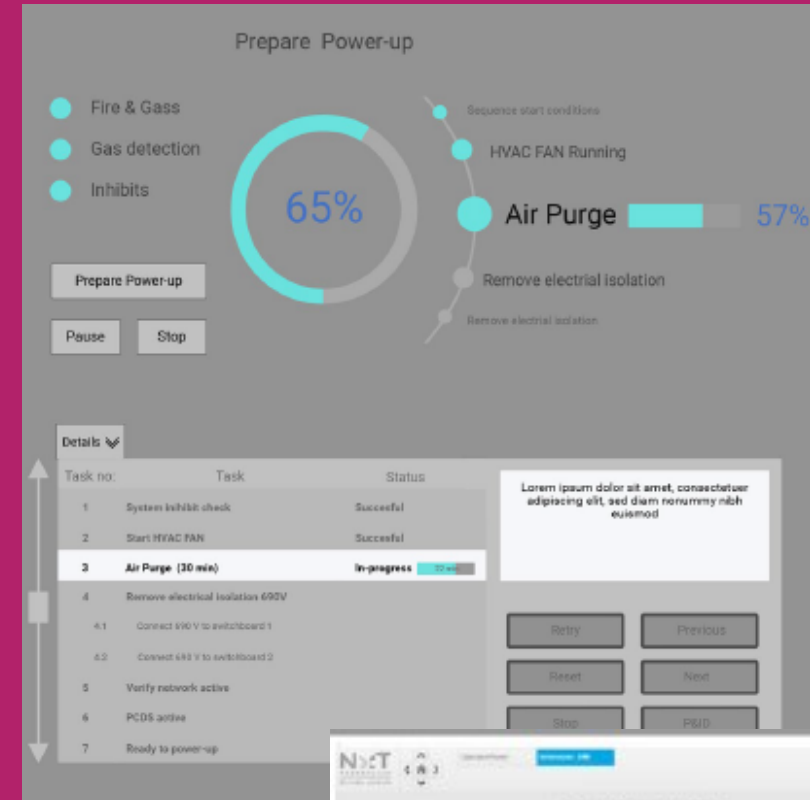

- initiating the OBS
- monitor progress and technical system
- observe the progress

KONGSBERG

Server-Side Application (IEC 61499)

Confidential Property of UniversalAutomation.org | 104

# Well Barrier Testing

- Periodical testing
- Release/spare capacity on the RCU (Real-Time Controllers)
- Release work-load for the operator by automating the procedure. Less pressure not to make manual mistakes.
- The test is executed in a minimum of time and consistent (no manual failure)

KONGSBERG

Server-Side Application (IEC 61499)

Confidential Property of UniversalAutomation.org | 105

# Pipeline Leak Detection

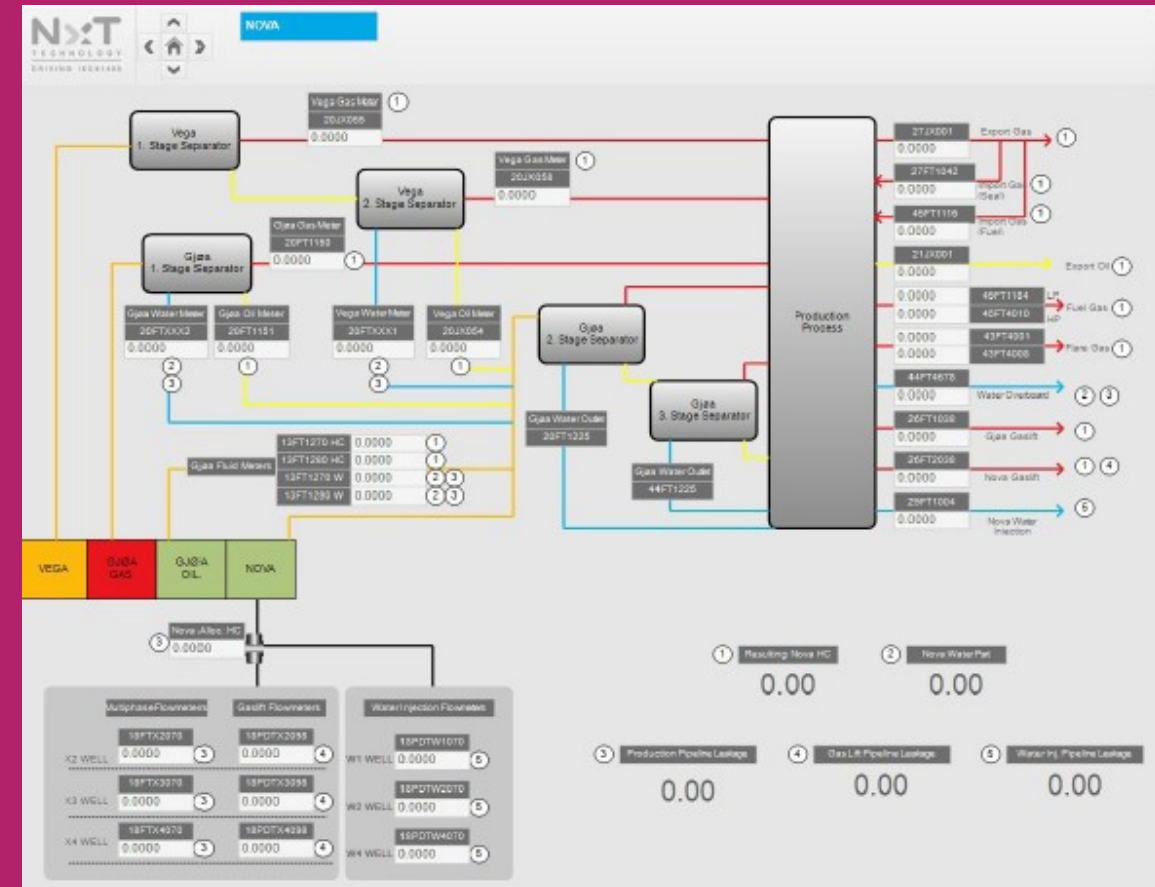

- Pipeline Leak Detection for
  - Production
  - Gas Lift
  - Water Injection
- The application detect any leakage by calculations
- Alarming
- Trending
- Warn the operator and give advise on action to take
- Save the environment
- Call for maintenance
- Save cost

KONGSBERG

Gr3n

# Asset-centric, Modular machine/process, IT/OT convergence

## Segment - PET Plastic Recycling: GR3N

### Challenge

Easily expand production using modular mechanical/electrical/control components

### Solution

- Reactor unit controls designed as an intelligent vendor-independent automation object
- Object includes not only process automation & HMI, but IT services such as track & trace

### Benefits

- Expanding capacity of process with no additional programming resulting in vastly reduced engineering time and time-to-market
- Vendor-independence allows controls to be distributed or centralized. Current project using Stahl ATEX controllers used
- Automatic reporting/logging of recycled waste

## Technical foundation for modularity in Gr3n

## Opportunities for Gr3n in UniversalAutomation.org

- **Modular engineering** of plant automation according to process modularity
- Reduction of **engineering costs** during market scale-up
- Improvement of **TCO for automation** in our plants
- New **IP protection routes** for our Reactive Units for depolymerization
- Additional optimization by means of **advanced Data Analytics**
- **OT-IT integration** translating into new value chain opportunities
